Control ScalarFormatter offsets directly and via the Axes.ticklabel_format() method, and add that to pyplot. -EF

**2010-04-16**

Add a close_event to the backends. -RM

**2010-04-06**

modify axes_grid examples to use axes_grid1 and axisartist. -JJL

**2010-04-06**

rebase axes_grid using axes_grid1 and axisartist modules. -JJL

**2010-04-06**

axes_grid toolkit is split into two separate modules, axes_grid1 and axisartist. -JJL

**2010-04-05**

Speed up import: import pytz only if and when it is needed. It is not needed if the rc timezone is UTC. - EF

**2010-04-03**

Added color kwarg to Axes.hist(), based on work by Jeff Klukas. - EF

**2010-03-24**

refactor colorbar code so that no cla() is necessary when mappable is changed. -JJL

**2010-03-22**

fix incorrect rubber band during the zoom mode when mouse leaves the axes. -JJL

**2010-03-21**

x/y key during the zoom mode only changes the x/y limits. -JJL

**2010-03-20**

Added pyplot.sca() function suggested by JJL. - EF

**2010-03-20**

Added conditional support for new Tooltip API in gtk backend. - EF

**2010-03-20**

Changed plt.fig_subplot() to plt.subplots() after discussion on list, and changed its API to return axes as a numpy object array (with control of dimensions via squeeze keyword). FP.

**2010-03-13**

Manually brought in commits from branch:

```
------------------------------------------------------------------------
r8191 | leejjoon | 2010-03-13
17:27:57 -0500 (Sat, 13 Mar 2010) | 1 line
```

fix the bug that handles for scatter are incorrectly set when dpi!=72. Thanks to Ray Speth for the bug report.

**2010-03-03**

Manually brought in commits from branch via diff/patch (svnmerge is broken):

```
------------------------------------------------------------------------
r8175 | leejjoon | 2010-03-03
10:03:30 -0800 (Wed, 03 Mar 2010) | 1 line

fix arguments of allow_rasterization.draw_wrapper
------------------------------------------------------------------------
r8174 | jdh2358 | 2010-03-03
09:15:58 -0800 (Wed, 03 Mar 2010) | 1 line

added support for favicon in docs build
------------------------------------------------------------------------
r8173 | jdh2358 | 2010-03-03
08:56:16 -0800 (Wed, 03 Mar 2010) | 1 line
```

(continues on next page)

(continued from previous page)

```
applied Mattias get_bounds patch
------------------------------------------------------------------------
r8172 | jdh2358 | 2010-03-03
08:31:42 -0800 (Wed, 03 Mar 2010) | 1 line

fix svnmerge download instructions
------------------------------------------------------------------------
r8171 | jdh2358 | 2010-03-03
07:47:48 -0800 (Wed, 03 Mar 2010) | 1 line
```

**2010-02-25**

add annotation_demo3.py that demonstrates new functionality. -JJL

**2010-02-25**

refactor Annotation to support arbitrary Transform as xycoords or textcoords. Also, if a tuple of two coordinates is provided, they are interpreted as coordinates for each x and y position. -JJL

**2010-02-24**

Added pyplot.fig_subplot(), to create a figure and a group of subplots in a single call. This offers an easier pattern than manually making figures and calling add_subplot() multiple times. FP

**2010-02-17**

Added Gokhan's and Mattias' customizable keybindings patch for the toolbar. You can now set the keymap.* properties in the matplotlibrc file. Newbindings were added for toggling log scaling on the x-axis. JDH

**2010-02-16**

Committed TJ's filled marker patch for left|right|bottom|top|full filled markers. See examples/pylab_examples/filledmarker_demo.py. JDH

**2010-02-11**

Added 'bootstrap' option to boxplot. This allows bootstrap estimates of median confidence intervals. Based on an initial patch by Paul Hobson. - ADS

**2010-02-06**

Added setup.cfg "basedirlist" option to override setting in setupext.py "basedir" dictionary; added "gnu0" platform requested by Benjamin Drung. - EF

**2010-02-06**

Added 'xy' scaling option to EllipseCollection. - EF

**2010-02-03**

Made plot_directive use a custom PlotWarning category, so that warnings can be turned into fatal errors easily if desired. - FP

**2010-01-29**

Added draggable method to Legend to allow mouse drag placement. Thanks Adam Fraser. JDH

**2010-01-25**

Fixed a bug reported by Olle Engdegard, when using histograms with stepfilled and log=True - MM

**2010-01-16**

Upgraded CXX to 6.1.1 - JDH

**2009-01-16**

Don't create minor ticks on top of existing major ticks. Patch by Neil Crighton. -ADS

**2009-01-16**

Ensure three minor ticks always drawn (SF# 2924245). Patch by Neil Crighton. -ADS

**2010-01-16**

Applied patch by Ian Thomas to fix two contouring problems: now contourf handles interior masked regions, and the boundaries of line and filled contours coincide. - EF

**2009-01-11**

The color of legend patch follows the rc parameters axes.facecolor and axes.edgecolor. -JJL

**2009-01-11**

adjustable of Axes can be "box-forced" which allow sharing axes. -JJL

**2009-01-11**

Add add_click and pop_click methods in BlockingContourLabeler. -JJL

**2010-01-03**

Added rcParams['axes.color_cycle'] - EF

**2010-01-03**

Added Pierre's qt4 formlayout editor and toolbar button - JDH

**2009-12-31**

Add support for using math text as marker symbols (Thanks to tcb) - MGD

**2009-12-31**

Commit a workaround for a regression in PyQt4-4.6.{0,1} - DSD

**2009-12-22**

Fix cmap data for gist_earth_r, etc. -JJL

**2009-12-20**

spines: put spines in data coordinates, add set_bounds() call. -ADS

**2009-12-18**

Don't limit notch size in boxplot to q1-q3 range, as this is effectively making the data look better than it is. - ADS

**2009-12-18**

mlab.prctile handles even-length data, such that the median is the mean of the two middle values. - ADS

**2009-12-15**

Add raw-image (unsampled) support for the ps backend. - JJL

**2009-12-14**

Add patch_artist kwarg to boxplot, but keep old default. Convert boxplot_demo2.py to use the new patch_artist. - ADS

**2009-12-06**

axes_grid: reimplemented AxisArtist with FloatingAxes support. Added new examples. - JJL

**2009-12-01**

Applied Laurent Dufrechou's patch to improve blitting with the qt4 backend - DSD

**2009-11-13**

The pdf backend now allows changing the contents of a pdf file's information dictionary via PdfPages.infodict. - JKS

**2009-11-12**

font_manager.py should no longer cause EINTR on Python 2.6 (but will on the 2.5 version of subprocess). Also the fc-list command in that file was fixed so now it should actually find the list of fontconfig fonts. - JKS

**2009-11-10**

Single images, and all images in renderers with option_image_nocomposite (i.e. agg, macosx and the svg backend when rcParams['svg.image_noscale'] is True), are now drawn respecting the zorder relative to other artists. (Note that there may now be inconsistencies across backends when more than one image is drawn at varying zorders, but this change introduces correct behavior for the backends in which it's easy to do so.)

**2009-10-21**

Make AutoDateLocator more configurable by adding options to control the maximum and minimum number of ticks. Also add control of the intervals to be used for ticking. This does not change behavior but opens previously hard-coded behavior to runtime modification`. - RMM

**2009-10-19**

Add "path_effects" support for Text and Patch. See examples/pylab_examples/patheffect_demo.py -JJL

**2009-10-19**

Add "use_clabeltext" option to clabel. If True, clabels will be created with ClabelText class, which recalculates rotation angle of the label during the drawing time. -JJL

**2009-10-16**

Make AutoDateFormatter actually use any specified timezone setting.This was only working correctly when no timezone was specified. - RMM

**2009-09-27**

Beginnings of a capability to test the pdf backend. - JKS

**2009-09-27**

Add a savefig.extension rcparam to control the default filename extension used by savefig. - JKS

---

**2009-09-21**

Tagged for release 0.99.1

**2009-09-20**

Fix usetex spacing errors in pdf backend. - JKS

**2009-09-20**

Add Sphinx extension to highlight IPython console sessions, originally authored (I think) by Michael Droetboom. - FP

**2009-09-20**

Fix off-by-one error in dviread.Tfm, and additionally protect against exceptions in case a dvi font is missing some metrics. - JKS

**2009-09-15**

Implement draw_text and draw_tex method of backend_base using the textpath module. Implement draw_tex method of the svg backend. - JJL

**2009-09-15**

Don't fail on AFM files containing floating-point bounding boxes - JKS

**2009-09-13**

AxesGrid : add modified version of colorbar. Add colorbar location howto. - JJL

**2009-09-07**

AxesGrid : implemented axisline style. Added a demo examples/axes_grid/demo_axisline_style.py- JJL

**2009-09-04**

Make the textpath class as a separate module (textpath.py). Add support for mathtext and tex.- JJL

**2009-09-01**

Added support for Gouraud interpolated triangles. pcolormesh now accepts shading='gouraud' as an option. - MGD

**2009-08-29**

Added matplotlib.testing package, which contains a Nose plugin and a decorator that lets tests be marked as KnownFailures - ADS

**2009-08-20**

Added scaled dict to AutoDateFormatter for customized scales - JDH

**2009-08-15**

Pyplot interface: the current image is now tracked at the figure and axes level, addressing tracker item 1656374. - EF

**2009-08-15**

Docstrings are now manipulated with decorators defined in a new module, docstring.py, thanks to Jason Coombs. - EF

**2009-08-14**

Add support for image filtering for agg back end. See the example demo_agg_filter.py. -JJL

**2009-08-09**

AnnotationBbox added. Similar to Annotation, but works with OffsetBox instead of Text. See the example demo_annotation_box.py. -JJL

**2009-08-07**

BboxImage implemented. Two examples, demo_bboximage.py and demo_ribbon_box.py added. -JJL

**2009-08-07**

In an effort to simplify the backend API, all clipping rectangles and paths are now passed in using GraphicsContext objects, even on collections and images. Therefore:

```
draw_path_collection(self, master_transform, cliprect, clippath,
                     clippath_trans, paths, all_transforms, offsets,
                     offsetTrans, facecolors, edgecolors, linewidths,
                     linestyles, antialiaseds, urls)
```

becomes:

```
draw_path_collection(self, gc, master_transform, paths, all_transforms,
                     offsets, offsetTrans, facecolors, edgecolors,
                     linewidths, linestyles, antialiaseds, urls)
```

```
draw_quad_mesh(self, master_transform, cliprect, clippath,
               clippath_trans, meshWidth, meshHeight, coordinates,
               offsets, offsetTrans, facecolors, antialiased,
               showedges)
```

becomes:

```
draw_quad_mesh(self, gc, master_transform, meshWidth, meshHeight,
               coordinates, offsets, offsetTrans, facecolors,
               antialiased, showedges)
```

```
draw_image(self, x, y, im, bbox, clippath=None, clippath_trans=None)
```

becomes:

```
draw_image(self, gc, x, y, im)
```

- MGD

**2009-08-06**

Tagging the 0.99.0 release at svn r7397 - JDH

- fixed an alpha colormapping bug posted on sf 2832575
- fix typo in axes_divider.py. use nanmin, nanmax in angle_helper.py (patch by Christoph Gohlke)
- remove dup gui event in enter/leave events in gtk
- lots of fixes for os x binaries (Thanks Russell Owen)
- attach gtk events to mpl events -- fixes sf bug 2816580
- applied sf patch 2815064 (middle button events for wx) and patch 2818092 (resize events for wx)
- fixed boilerplate.py so it doesn't break the ReST docs.
- removed a couple of cases of mlab.load
- fixed rec2csv win32 file handle bug from sf patch 2831018
- added two examples from Josh Hemann: examples/pylab_examples/barchart_demo2.py and examples/pylab_examples/boxplot_demo2.py
- handled sf bugs 2831556 and 2830525; better bar error messages and backend driver configs
- added miktex win32 patch from sf patch 2820194
- apply sf patches 2830233 and 2823885 for osx setup and 64 bit; thanks Michiel

**2009-08-04**

Made cbook.get_sample_data make use of the ETag and Last-Modified headers of mod_dav_svn. - JKS

**2009-08-03**

Add PathCollection; modify contourf to use complex paths instead of simple paths with cuts. - EF

**2009-08-03**

Fixed boilerplate.py so it doesn't break the ReST docs. - JKS

**2009-08-03**

pylab no longer provides a load and save function. These are available in matplotlib.mlab, or you can use numpy.loadtxt and numpy.savetxt for text files, or np.save and np.load for binary numpy arrays. - JDH

**2009-07-31**

Added cbook.get_sample_data for urllib enabled fetching and caching of data needed for examples. See examples/misc/sample_data_demo.py - JDH

**2009-07-31**

Tagging 0.99.0.rc1 at 7314 - MGD

**2009-07-30**

Add set_cmap and register_cmap, and improve get_cmap, to provide convenient handling of user-generated colormaps. Reorganized _cm and cm modules. - EF

**2009-07-28**

Quiver speed improved, thanks to tip by Ray Speth. -EF

**2009-07-27**

Simplify argument handling code for plot method. -EF

**2009-07-25**

Allow "plot(1, 2, 'r*')" to work. - EF

**2009-07-22**

Added an 'interp' keyword to griddata so the faster linear interpolation method can be chosen. Default is 'nn', so default behavior (using natural neighbor method) is unchanged (JSW)

**2009-07-22**

Improved boilerplate.py so that it generates the correct signatures for pyplot functions. - JKS

**2009-07-19**

Fixed the docstring of Axes.step to reflect the correct meaning of the kwargs "pre" and "post" - See SF bug https://sourceforge.net/tracker/index.php?func=detail&aid=2823304&group_id=80706&atid=560720 - JDH

**2009-07-18**

Fix support for hatches without color fills to pdf and svg backends. Add an example of that to hatch_demo.py. - JKS

**2009-07-17**

Removed fossils from swig version of agg backend. - EF

**2009-07-14**

initial submission of the annotation guide. -JJL

**2009-07-14**

axes_grid : minor improvements in anchored_artists and inset_locator. -JJL

**2009-07-14**

Fix a few bugs in ConnectionStyle algorithms. Add ConnectionPatch class. -JJL

**2009-07-11**

Added a fillstyle Line2D property for half filled markers -- see examples/pylab_examples/fillstyle_demo.py JDH

**2009-07-08**

Attempt to improve performance of qt4 backend, do not call qApp.processEvents while processing an event. Thanks Ole Streicher for tracking this down - DSD

**2009-06-24**

Add withheader option to mlab.rec2csv and changed use_mrecords default to False in mlab.csv2rec since this is partially broken - JDH

**2009-06-24**

backend_agg.draw_marker quantizes the main path (as in the draw_path). - JJL

**2009-06-24**

axes_grid: floating axis support added. - JJL

**2009-06-14**

Add new command line options to backend_driver.py to support running only some directories of tests - JKS

**2009-06-13**

partial cleanup of mlab and its importation in pylab - EF

**2009-06-13**

Introduce a rotation_mode property for the Text artist. See examples/pylab_examples/demo_text_rotation_mode.py -JJL

**2009-06-07**

add support for bz2 files per sf support request 2794556 - JDH

**2009-06-06**

added a properties method to the artist and inspector to return a dict mapping property name -> value; see sf feature request 2792183 - JDH

**2009-06-06**

added Neil's auto minor tick patch; sf patch #2789713 - JDH

**2009-06-06**

do not apply alpha to rgba color conversion if input is already rgba - JDH

**2009-06-03**

axes_grid : Initial check-in of curvelinear grid support. See examples/axes_grid/demo_curvelinear_grid.py - JJL

**2009-06-01**

Add set_color method to Patch - EF

**2009-06-01**

Spine is now derived from Patch - ADS

**2009-06-01**

use cbook.is_string_like() instead of isinstance() for spines - ADS

**2009-06-01**

cla() support for spines - ADS

**2009-06-01**

Removed support for gtk < 2.4. - EF

**2009-05-29**

Improved the animation_blit_qt4 example, which was a mix of the object-oriented and pylab interfaces. It is now strictly object-oriented - DSD

**2009-05-28**

Fix axes_grid toolkit to work with spine patch by ADS. - JJL

**2009-05-28**

Applied fbianco's patch to handle scroll wheel events in the qt4 backend - DSD

**2009-05-26**

Add support for "axis spines" to have arbitrary location. -ADS

**2009-05-20**

Add an empty matplotlibrc to the tests/ directory so that running tests will use the default set of rcparams rather than the user's config. - RMM

**2009-05-19**

Axis.grid(): allow use of which='major,minor' to have grid on major and minor ticks. -ADS

**2009-05-18**

Make psd(), csd(), and cohere() wrap properly for complex/two-sided versions, like specgram() (SF #2791686) - RMM

**2009-05-18**

Fix the linespacing bug of multiline text (#1239682). See examples/pylab_examples/multiline.py -JJL

**2009-05-18**

Add *annotation_clip* attr. for text.Annotation class. If True, annotation is only drawn when the annotated point is inside the axes area. -JJL

**2009-05-17**

Fix bug(#2749174) that some properties of minor ticks are not conserved -JJL

**2009-05-17**

applied Michiel's sf patch 2790638 to turn off gtk event loop in setupext for pygtk>=2.15.10 - JDH

**2009-05-17**

applied Michiel's sf patch 2792742 to speed up Cairo and macosx collections; speedups can be 20x. Also fixes some bugs in which gc got into inconsistent state

---

**2008-05-17**

Release 0.98.5.3 at r7107 from the branch - JDH

**2009-05-13**

An optional offset and bbox support in restore_bbox. Add animation_blit_gtk2.py. -JJL

**2009-05-13**

psfrag in backend_ps now uses baseline-alignment when preview.sty is used ((default is bottom-alignment). Also, a small API improvement in OffsetBox-JJL

**2009-05-13**

When the x-coordinate of a line is monotonically increasing, it is now automatically clipped at the stage of generating the transformed path in the draw method; this greatly speeds up zooming and panning when one is looking at a short segment of a long time series, for example. - EF

**2009-05-11**

aspect=1 in log-log plot gives square decades. -JJL

**2009-05-08**

clabel takes new kwarg, rightside_up; if False, labels will not be flipped to keep them rightside-up. This allows the use of clabel to make streamfunction arrows, as requested by Evan Mason. - EF

**2009-05-07**

'labelpad' can now be passed when setting x/y labels. This allows controlling the spacing between the label and its axis. - RMM

**2009-05-06**

print_ps now uses mixed-mode renderer. Axes.draw rasterize artists whose zorder smaller than rasterization_zorder. -JJL

**2009-05-06**

Per-artist Rasterization, originally by Eric Bruning. -JJ

**2009-05-05**

Add an example that shows how to make a plot that updates using data from another process. Thanks to Robert Cimrman - RMM

**2009-05-05**

Add Axes.get_legend_handles_labels method. - JJL

**2009-05-04**

Fix bug that Text.Annotation is still drawn while set to not visible. - JJL

**2009-05-04**

Added TJ's fill_betweenx patch - JDH

**2009-05-02**

Added options to plotfile based on question from Joseph Smidt and patch by Matthias Michler. - EF

**2009-05-01**

Changed add_artist and similar Axes methods to return their argument. - EF

**2009-04-30**

Incorrect eps bbox for landscape mode fixed - JJL

**2009-04-28**

Fixed incorrect bbox of eps output when usetex=True. - JJL

**2009-04-24**

Changed use of os.open* to instead use subprocess.Popen. os.popen* are deprecated in 2.6 and are removed in 3.0. - RMM

**2009-04-20**

Worked on axes_grid documentation. Added axes_grid.inset_locator. - JJL

**2009-04-17**

Initial check-in of the axes_grid toolkit. - JJL

**2009-04-17**

Added a support for bbox_to_anchor in offsetbox.AnchoredOffsetbox. Improved a documentation. - JJL

**2009-04-16**

Fixed a offsetbox bug that multiline texts are not correctly aligned. - JJL

**2009-04-16**

Fixed a bug in mixed mode renderer that images produced by an rasterizing backend are placed with incorrect size. - JJL

**2009-04-14**

Added Jonathan Taylor's Reinier Heeres' port of John Porters' mplot3d to svn trunk. Package in mpl_toolkits.mplot3d and demo is examples/mplot3d/demo.py. Thanks Reiner

**2009-04-06**

The pdf backend now escapes newlines and linefeeds in strings. Fixes sf bug #2708559; thanks to Tiago Pereira for the report.

**2009-04-06**

texmanager.make_dvi now raises an error if LaTeX failed to create an output file. Thanks to Joao Luis Silva for reporting this. - JKS

**2009-04-05**

_png.read_png() reads 12 bit PNGs (patch from Tobias Wood) - ADS

**2009-04-04**

Allow log axis scale to clip non-positive values to small positive value; this is useful for errorbars. - EF

**2009-03-28**

Make images handle nan in their array argument. A helper, cbook.safe_masked_invalid() was added. - EF

**2009-03-25**

Make contour and contourf handle nan in their Z argument. - EF

**2009-03-20**

Add AuxTransformBox in offsetbox.py to support some transformation. anchored_text.py example is enhanced and renamed (anchored_artists.py). - JJL

**2009-03-20**

Add "bar" connection style for annotation - JJL

**2009-03-17**

Fix bugs in edge color handling by contourf, found by Jae-Joon Lee. - EF

**2009-03-14**

Added 'LightSource' class to colors module for creating shaded relief maps. shading_example.py added to illustrate usage. - JSW

**2009-03-11**

Ensure wx version >= 2.8; thanks to Sandro Tosi and Chris Barker. - EF

**2009-03-10**

Fix join style bug in pdf. - JKS

**2009-03-07**

Add pyplot access to figure number list - EF

**2009-02-28**

hashing of FontProperties accounts current rcParams - JJL

**2009-02-28**

Prevent double-rendering of shared axis in twinx, twiny - EF

**2009-02-26**

Add optional bbox_to_anchor argument for legend class - JJL

**2009-02-26**

Support image clipping in pdf backend. - JKS

**2009-02-25**

Improve tick location subset choice in FixedLocator. - EF

**2009-02-24**

Deprecate numerix, and strip out all but the numpy part of the code. - EF

**2009-02-21**

Improve scatter argument handling; add an early error message, allow inputs to have more than one dimension. - EF

**2009-02-16**

Move plot_directive.py to the installed source tree. Add support for inline code content - MGD

**2009-02-16**

Move mathmpl.py to the installed source tree so it is available to other projects. - MGD

**2009-02-14**

Added the legend title support - JJL

**2009-02-10**

Fixed a bug in backend_pdf so it doesn't break when the setting pdf.use14corefonts=True is used. Added test case in unit/test_pdf_use14corefonts.py. - NGR

**2009-02-08**

Added a new imsave function to image.py and exposed it in the pyplot interface - GR

**2009-02-04**

Some reorganization of the legend code. anchored_text.py added as an example. - JJL

**2009-02-04**

Add extent keyword arg to hexbin - ADS

**2009-02-04**

Fix bug in mathtext related to dots and ldots - MGD

**2009-02-03**

Change default joinstyle to round - MGD

**2009-02-02**

Reduce number of marker XObjects in pdf output - JKS

**2009-02-02**

Change default resolution on polar plot to 1 - MGD

**2009-02-02**

Avoid malloc errors in ttconv for fonts that don't have e.g., PostName (a version of Tahoma triggered this) - JKS

**2009-01-30**

Remove support for pyExcelerator in exceltools -- use xlwt instead - JDH

**2009-01-29**

Document 'resolution' kwarg for polar plots. Support it when using pyplot.polar, not just Figure.add_axes. - MGD

**2009-01-29**

Rework the nan-handling/clipping/quantizing/simplification framework so each is an independent part of a pipeline. Expose the C++-implementation of all of this so it can be used from all Python backends. Add rcParam "path.simplify_threshold" to control the threshold of similarity below which vertices will be removed.

**2009-01-26**

Improved tight bbox option of the savefig. - JJL

**2009-01-26**

Make curves and NaNs play nice together - MGD

**2009-01-21**

Changed the defaults of acorr and xcorr to use usevlines=True, maxlags=10 and normed=True since these are the best defaults

**2009-01-19**

Fix bug in quiver argument handling. - EF

**2009-01-19**

Fix bug in backend_gtk: don't delete nonexistent toolbar. - EF

**2009-01-16**

Implement bbox_inches option for savefig. If bbox_inches is "tight", try to determine the tight bounding box. - JJL

**2009-01-16**

Fix bug in is_string_like so it doesn't raise an unnecessary exception. - EF

**2009-01-16**

Fix an infinite recursion in the unit registry when searching for a converter for a sequence of strings. Add a corresponding test. - RM

**2009-01-16**

Bugfix of C typedef of MPL_Int64 that was failing on Windows XP 64 bit, as reported by George Goussard on numpy mailing list. - ADS

**2009-01-16**

Added helper function LinearSegmentedColormap.from_list to facilitate building simple custom colomaps. See examples/pylab_examples/custom_cmap_fromlist.py - JDH

**2009-01-16**

Applied Michiel's patch for macosx backend to fix rounding bug. Closed sf bug 2508440 - JSW

**2009-01-10**

Applied Michiel's hatch patch for macosx backend and draw_idle patch for qt. Closes sf patched 2497785 and 2468809 - JDH

**2009-01-10**

Fix bug in pan/zoom with log coordinates. - EF

**2009-01-06**

Fix bug in setting of dashed negative contours. - EF

**2009-01-06**

Be fault tolerant when len(linestyles)>NLev in contour. - MM

**2009-01-06**

Added marginals kwarg to hexbin to plot marginal densities JDH

**2009-01-06**

Change user-visible multipage pdf object to PdfPages to avoid accidents with the file-like PdfFile. - JKS

**2009-01-05**

Fix a bug in pdf usetex: allow using non-embedded fonts. - JKS

**2009-01-05**

optional use of preview.sty in usetex mode. - JJL

**2009-01-02**

Allow multipage pdf files. - JKS

**2008-12-31**

Improve pdf usetex by adding support for font effects (slanting and extending). - JKS

**2008-12-29**

Fix a bug in pdf usetex support, which occurred if the same Type-1 font was used with different encodings, e.g., with Minion Pro and MnSymbol. - JKS

**2008-12-20**

fix the dpi-dependent offset of Shadow. - JJL

**2008-12-20**

fix the hatch bug in the pdf backend. minor update in docs and example - JJL

**2008-12-19**

Add axes_locator attribute in Axes. Two examples are added. - JJL

**2008-12-19**

Update Axes.legend documentation. /api/api_changes.rst is also updated to describe changes in keyword parameters. Issue a warning if old keyword parameters are used. - JJL

**2008-12-18**

add new arrow style, a line + filled triangles. -JJL

---

**2008-12-18**

Re-Released 0.98.5.2 from v0_98_5_maint at r6679 Released 0.98.5.2 from v0_98_5_maint at r6667

**2008-12-18**

Removed configobj, experimental traits and doc/mpl_data link - JDH

**2008-12-18**

Fix bug where a line with NULL data limits prevents subsequent data limits from calculating correctly - MGD

**2008-12-17**

Major documentation generator changes - MGD

**2008-12-17**

Applied macosx backend patch with support for path collections, quadmesh, etc... - JDH

**2008-12-17**

fix dpi-dependent behavior of text bbox and arrow in annotate -JJL

**2008-12-17**

Add group id support in artist. Two examples which demonstrate svg filter are added. -JJL

**2008-12-16**

Another attempt to fix dpi-dependent behavior of Legend. -JJL

**2008-12-16**

Fixed dpi-dependent behavior of Legend and fancybox in Text.

**2008-12-16**

Added markevery property to Line2D to support subsampling of markers - JDH

**2008-12-15**

Removed mpl_data symlink in docs. On platforms that do not support symlinks, these become copies, and the font files are large, so the distro becomes unnecessarily bloated. Keeping the mpl_examples dir because relative links are harder for the plot directive and the *.py files are not so large. - JDH

**2008-12-15**

Fix $ in non-math text with usetex off. Document differences between usetex on/off - MGD

**2008-12-15**

Fix anti-aliasing when auto-snapping - MGD

**2008-12-15**

Fix grid lines not moving correctly during pan and zoom - MGD

**2008-12-12**

Preparations to eliminate maskedarray rcParams key: its use will now generate a warning. Similarly, importing the obsolete numerix.npyma will generate a warning. - EF

**2008-12-12**

Added support for the numpy.histogram() weights parameter to the axes hist() method. Docs taken from numpy - MM

**2008-12-12**

Fixed warning in hist() with numpy 1.2 - MM

**2008-12-12**

Removed external packages: configobj and enthought.traits which are only required by the experimental traited config and are somewhat out of date. If needed, install them independently, see http://code.enthought.com/pages/traits.html and http://www.voidspace.org.uk/python/configobj.html

**2008-12-12**

Added support to assign labels to histograms of multiple data. - MM

---

**2008-12-11**

Released 0.98.5 at svn r6573

**2008-12-11**

Use subprocess.Popen instead of os.popen in dviread (Windows problem reported by Jorgen Stenarson) - JKS

**2008-12-10**

Added Michael's font_manager fix and Jae-Joon's figure/subplot fix. Bumped version number to 0.98.5 - JDH

---

**2008-12-09**

Released 0.98.4 at svn r6536

**2008-12-08**

Added mdehoon's native macosx backend from sf patch 2179017 - JDH

**2008-12-08**

Removed the prints in the set_*style commands. Return the list of pprinted strings instead - JDH

**2008-12-08**

Some of the changes Michael made to improve the output of the property tables in the rest docs broke of made difficult to use some of the interactive doc helpers, e.g., setp and getp. Having all the rest markup in the ipython shell also confused the docstrings. I added a new rc param docstring.hardcopy, to format the docstrings differently for hard copy and other use. The ArtistInspector could use a little refactoring now since there is duplication of effort between the rest out put and the non-rest output - JDH

**2008-12-08**

Updated spectral methods (psd, csd, etc.) to scale one-sided densities by a factor of 2 and, optionally, scale all densities by the sampling frequency. This gives better MatLab compatibility. -RM

**2008-12-08**

Fixed alignment of ticks in colorbars. -MGD

**2008-12-07**

drop the deprecated "new" keyword of np.histogram() for numpy 1.2 or later. -JJL

**2008-12-06**

Fixed a bug in svg backend that new_figure_manager() ignores keywords arguments such as figsize, etc. -JJL

**2008-12-05**

Fixed a bug that the handlelength of the new legend class set too short when numpoints=1 -JJL

**2008-12-04**

Added support for data with units (e.g., dates) to Axes.fill_between. -RM

**2008-12-04**

Added fancybox keyword to legend. Also applied some changes for better look, including baseline adjustment of the multiline texts so that it is center aligned. -JJL

**2008-12-02**

The transmuter classes in the patches.py are reorganized as subclasses of the Style classes. A few more box and arrow styles are added. -JJL

**2008-12-02**

Fixed a bug in the new legend class that didn't allowed a tuple of coordinate values as loc. -JJL

**2008-12-02**

Improve checks for external dependencies, using subprocess (instead of deprecated popen*) and distutils (for version checking) - DSD

**2008-11-30**

Reimplementation of the legend which supports baseline alignment, multi-column, and expand mode. - JJL

**2008-12-01**

Fixed histogram autoscaling bug when bins or range are given explicitly (fixes Debian bug 503148) - MM

**2008-11-25**

Added rcParam axes.unicode_minus which allows plain hyphen for minus when False - JDH

**2008-11-25**

Added scatterpoints support in Legend. patch by Erik Tollerud - JJL

**2008-11-24**

Fix crash in log ticking. - MGD

**2008-11-20**

Added static helper method BrokenHBarCollection.span_where and Axes/pyplot method fill_between. See examples/pylab/fill_between.py - JDH

**2008-11-12**

Add x_isdata and y_isdata attributes to Artist instances, and use them to determine whether either or both coordinates are used when updating dataLim. This is used to fix autoscaling problems that had been triggered by axhline, axhspan, axvline, axvspan. - EF

**2008-11-11**

Update the psd(), csd(), cohere(), and specgram() methods of Axes and the csd() cohere(), and specgram() functions in mlab to be in sync with the changes to psd(). In fact, under the hood, these all call the same core to do computations. - RM

**2008-11-11**

Add 'pad_to' and 'sides' parameters to mlab.psd() to allow controlling of zero padding and returning of negative frequency components, respectively. These are added in a way that does not change the API. - RM

**2008-11-10**

Fix handling of c kwarg by scatter; generalize is_string_like to accept numpy and numpy.ma string array scalars. - RM and EF

**2008-11-09**

Fix a possible EINTR problem in dviread, which might help when saving pdf files from the qt backend. - JKS

**2008-11-05**

Fix bug with zoom to rectangle and twin axes - MGD

**2008-10-24**

Added Jae Joon's fancy arrow, box and annotation enhancements -- see examples/pylab_examples/annotation_demo2.py

**2008-10-23**

Autoscaling is now supported with shared axes - EF

**2008-10-23**

Fixed exception in dviread that happened with Minion - JKS

**2008-10-21**

set_xlim, ylim now return a copy of the viewlim array to avoid modify inplace surprises

**2008-10-20**

Added image thumbnail generating function matplotlib.image.thumbnail. See examples/misc/image_thumbnail.py - JDH

**2008-10-20**

Applied scatleg patch based on ideas and work by Erik Tollerud and Jae-Joon Lee. - MM

**2008-10-11**

Fixed bug in pdf backend: if you pass a file object for output instead of a filename, e.g., in a wep app, we now flush the object at the end. - JKS

**2008-10-08**

Add path simplification support to paths with gaps. - EF

**2008-10-05**

Fix problem with AFM files that don't specify the font's full name or family name. - JKS

**2008-10-04**

Added 'scilimits' kwarg to Axes.ticklabel_format() method, for easy access to the set_powerlimits method of the major ScalarFormatter. - EF

**2008-10-04**

Experimental new kwarg borderpad to replace pad in legend, based on suggestion by Jae-Joon Lee. - EF

**2008-09-27**

Allow spy to ignore zero values in sparse arrays, based on patch by Tony Yu. Also fixed plot to handle empty data arrays, and fixed handling of markers in figlegend. - EF

**2008-09-24**

Introduce drawstyles for lines. Transparently split linestyles like 'steps--' into drawstyle 'steps' and linestyle '--'. Legends always use drawstyle 'default'. - MM

**2008-09-18**

Fixed quiver and quiverkey bugs (failure to scale properly when resizing) and added additional methods for determining the arrow angles - EF

**2008-09-18**

Fix polar interpolation to handle negative values of theta - MGD

**2008-09-14**

Reorganized cbook and mlab methods related to numerical calculations that have little to do with the goals of those two modules into a separate module numerical_methods.py Also, added ability to select points and stop point selection with keyboard in ginput and manual contour labeling code. Finally, fixed contour labeling bug. - DMK

**2008-09-11**

Fix backtick in Postscript output. - MGD

**2008-09-10**

[ 2089958 ] Path simplification for vector output backends Leverage the simplification code exposed through path_to_polygons to simplify certain well-behaved paths in the vector backends (PDF, PS and SVG). "path.simplify" must be set to True in matplotlibrc for this to work. - MGD

**2008-09-10**

Add "filled" kwarg to Path.intersects_path and Path.intersects_bbox. - MGD

**2008-09-07**

Changed full arrows slightly to avoid an xpdf rendering problem reported by Friedrich Hagedorn. - JKS

**2008-09-07**

Fix conversion of quadratic to cubic Bezier curves in PDF and PS backends. Patch by Jae-Joon Lee. - JKS

**2008-09-06**

Added 5-point star marker to plot command - EF

**2008-09-05**

Fix hatching in PS backend - MGD

**2008-09-03**

Fix log with base 2 - MGD

**2008-09-01**

Added support for bilinear interpolation in NonUniformImage; patch by Gregory Lielens. - EF

**2008-08-28**

Added support for multiple histograms with data of different length - MM

**2008-08-28**

Fix step plots with log scale - MGD

**2008-08-28**

Fix masked arrays with markers in non-Agg backends - MGD

**2008-08-28**

Fix clip_on kwarg so it actually works correctly - MGD

**2008-08-25**

Fix locale problems in SVG backend - MGD

**2008-08-22**

fix quiver so masked values are not plotted - JSW

**2008-08-18**

improve interactive pan/zoom in qt4 backend on windows - DSD

**2008-08-11**

Fix more bugs in NaN/inf handling. In particular, path simplification (which does not handle NaNs or infs) will be turned off automatically when infs or NaNs are present. Also masked arrays are now converted to arrays with NaNs for consistent handling of masks and NaNs - MGD and EF

---

**2008-08-03**

Released 0.98.3 at svn r5947

**2008-08-01**

Backported memory leak fixes in _ttconv.cpp - MGD

**2008-07-31**

Added masked array support to griddata. - JSW

**2008-07-26**

Added optional C and reduce_C_function arguments to axes.hexbin(). This allows hexbin to accumulate the values of C based on the x,y coordinates and display in hexagonal bins. - ADS

**2008-07-24**

Deprecated (raise NotImplementedError) all the mlab2 functions from matplotlib.mlab out of concern that some of them were not clean room implementations. JDH

**2008-07-24**

Rewrite of a significant portion of the clabel code (class ContourLabeler) to improve inlining. - DMK

**2008-07-22**

Added Barbs polygon collection (similar to Quiver) for plotting wind barbs. Added corresponding helpers to Axes and pyplot as well. (examples/pylab_examples/barb_demo.py shows it off.) - RMM

**2008-07-21**

Added scikits.delaunay as matplotlib.delaunay. Added griddata function in matplotlib.mlab, with example (griddata_demo.py) in pylab_examples. griddata function will use mpl_toolkits._natgrid if installed. - JSW

**2008-07-21**

Re-introduced offset_copy that works in the context of the new transforms. - MGD

**2008-07-21**

Committed patch by Ryan May to add get_offsets and set_offsets to Collections base class - EF

**2008-07-21**

Changed the "asarray" strategy in image.py so that colormapping of masked input should work for all image types (thanks Klaus Zimmerman) - EF

**2008-07-20**

Rewrote cbook.delete_masked_points and corresponding unit test to support rgb color array inputs, datetime inputs, etc. - EF

**2008-07-20**

Renamed unit/axes_unit.py to cbook_unit.py and modified in accord with Ryan's move of delete_masked_points from axes to cbook. - EF

**2008-07-18**

Check for nan and inf in axes.delete_masked_points(). This should help hexbin and scatter deal with nans. - ADS

**2008-07-17**

Added ability to manually select contour label locations. Also added a waitforbuttonpress function. - DMK

**2008-07-17**

Fix bug with NaNs at end of path (thanks, Andrew Straw for the report) - MGD

**2008-07-16**

Improve error handling in texmanager, thanks to Ian Henry for reporting - DSD

**2008-07-12**

Added support for external backends with the "module://my_backend" syntax - JDH

**2008-07-11**

Fix memory leak related to shared axes. Grouper should store weak references. - MGD

**2008-07-10**

Bugfix: crash displaying fontconfig pattern - MGD

**2008-07-10**

Bugfix: [ 2013963 ] update_datalim_bounds in Axes not works - MGD

**2008-07-10**

Bugfix: [ 2014183 ] multiple imshow() causes gray edges - MGD

**2008-07-09**

Fix rectangular axes patch on polar plots bug - MGD

**2008-07-09**

Improve mathtext radical rendering - MGD

**2008-07-08**

Improve mathtext superscript placement - MGD

**2008-07-07**

Fix custom scales in pcolormesh (thanks Matthew Turk) - MGD

**2008-07-03**

Implemented findobj method for artist and pyplot - see examples/pylab_examples/findobj_demo.py - JDH

**2008-06-30**

Another attempt to fix TextWithDash - DSD

**2008-06-30**

Removed Qt4 NavigationToolbar2.destroy -- it appears to have been unnecessary and caused a bug reported by P. Raybaut - DSD

**2008-06-27**

Fixed tick positioning bug - MM

**2008-06-27**

Fix dashed text bug where text was at the wrong end of the dash - MGD

**2008-06-26**

Fix mathtext bug for expressions like $x_{leftarrow}$ - MGD

**2008-06-26**

Fix direction of horizontal/vertical hatches - MGD

**2008-06-25**

Figure.figurePatch renamed Figure.patch, Axes.axesPatch renamed Axes.patch, Axes.axesFrame renamed Axes.frame, Axes.get_frame, which returns Axes.patch, is deprecated. Examples and users guide updated - JDH

**2008-06-25**

Fix rendering quality of pcolor - MGD

---

**2008-06-24**

Released 0.98.2 at svn r5667 - (source only for debian) JDH

**2008-06-24**

Added "transparent" kwarg to savefig. - MGD

**2008-06-24**

Applied Stefan's patch to draw a single centered marker over a line with numpoints==1 - JDH

**2008-06-23**

Use splines to render circles in scatter plots - MGD

---

**2008-06-22**

Released 0.98.1 at revision 5637

**2008-06-22**

Removed axes3d support and replaced it with a NotImplementedError for one release cycle

**2008-06-21**

fix marker placement bug in backend_ps - DSD

**2008-06-20**

[ 1978629 ] scale documentation missing/incorrect for log - MGD

**2008-06-20**

Added closed kwarg to PolyCollection. Fixes bug [ 1994535 ] still missing lines on graph with svn (r 5548). - MGD

**2008-06-20**

Added set/get_closed method to Polygon; fixes error in hist - MM

**2008-06-19**

Use relative font sizes (e.g., 'medium' and 'large') in rcsetup.py and matplotlibrc.template so that text will be scaled by default when changing rcParams['font.size'] - EF

**2008-06-17**

Add a generic PatchCollection class that can contain any kind of patch. - MGD

**2008-06-13**

Change pie chart label alignment to avoid having labels overwrite the pie - MGD

**2008-06-12**

Added some helper functions to the mathtext parser to return bitmap arrays or write pngs to make it easier to use mathtext outside the context of an mpl figure. modified the mathpng sphinxext to use the mathtext png save functionality - see examples/api/mathtext_asarray.py - JDH

**2008-06-11**

Use matplotlib.mathtext to render math expressions in online docs - MGD

**2008-06-11**

Move PNG loading/saving to its own extension module, and remove duplicate code in _backend_agg.cpp and _image.cpp that does the same thing - MGD

**2008-06-11**

Numerous mathtext bugfixes, primarily related to dpi-independence - MGD

**2008-06-10**

Bar now applies the label only to the first patch only, and sets '_nolegend_' for the other patch labels. This lets autolegend work as expected for hist and bar - see https://sourceforge.net/tracker/index.php?func=detail&aid=1986597&group_id=80706&atid=560720 JDH

**2008-06-10**

Fix text baseline alignment bug. [ 1985420 ] Repair of baseline alignment in Text._get_layout. Thanks Stan West - MGD

**2008-06-09**

Committed Gregor's image resample patch to downsampling images with new rcparam image.resample - JDH

**2008-06-09**

Don't install Enthought.Traits along with matplotlib. For matplotlib developers convenience, it can still be installed by setting an option in setup.cfg while we figure decide if there is a future for the traited config - DSD

**2008-06-09**

Added range keyword arg to hist() - MM

**2008-06-07**

Moved list of backends to rcsetup.py; made use of lower case for backend names consistent; use validate_backend when importing backends subpackage - EF

**2008-06-06**

hist() revision, applied ideas proposed by Erik Tollerud and Olle Engdegard: make histtype='step' unfilled by default and introduce histtype='stepfilled'; use default color cycle; introduce reverse cumulative histogram; new align keyword - MM

**2008-06-06**

Fix closed polygon patch and also provide the option to not close the polygon - MGD

**2008-06-05**

Fix some dpi-changing-related problems with PolyCollection, as called by Axes.scatter() - MGD

**2008-06-05**

Fix image drawing so there is no extra space to the right or bottom - MGD

**2006-06-04**

Added a figure title command suptitle as a Figure method and pyplot command -- see examples/figure_title.py - JDH

**2008-06-02**

Added support for log to hist with histtype='step' and fixed a bug for log-scale stacked histograms - MM

---

**2008-05-29**

Released 0.98.0 at revision 5314

**2008-05-29**

matplotlib.image.imread now no longer always returns RGBA -- if the image is luminance or RGB, it will return a MxN or MxNx3 array if possible. Also uint8 is no longer always forced to float.

**2008-05-29**

Implement path clipping in PS backend - JDH

**2008-05-29**

Fixed two bugs in texmanager.py: improved comparison of dvipng versions fixed a bug introduced when get_grey method was added - DSD

**2008-05-28**

Fix crashing of PDFs in xpdf and ghostscript when two-byte characters are used with Type 3 fonts - MGD

**2008-05-28**

Allow keyword args to configure widget properties as requested in http://sourceforge.net/tracker/index.php?func=detail&aid=1866207&group_id=80706&atid=560722 - JDH

**2008-05-28**

Replaced '-' with u'\u2212' for minus sign as requested in http://sourceforge.net/tracker/index.php?func=detail&aid=1962574&group_id=80706&atid=560720

**2008-05-28**

zero width/height Rectangles no longer influence the autoscaler. Useful for log histograms with empty bins - JDH

**2008-05-28**

Fix rendering of composite glyphs in Type 3 conversion (particularly as evidenced in the Eunjin.ttf Korean font) Thanks Jae-Joon Lee for finding this!

**2008-05-27**

Rewrote the cm.ScalarMappable callback infrastructure to use cbook.CallbackRegistry rather than custom callback handling. Any users of add_observer/notify of the cm.ScalarMappable should use the cm.ScalarMappable.callbacksSM CallbackRegistry instead. JDH

**2008-05-27**

Fix TkAgg build on Ubuntu 8.04 (and hopefully a more general solution for other platforms, too.)

**2008-05-24**

Added PIL support for loading images to imread (if PIL is available) - JDH

**2008-05-23**

Provided a function and a method for controlling the plot color cycle. - EF

**2008-05-23**

Major revision of hist(). Can handle 2D arrays and create stacked histogram plots; keyword 'width' deprecated and rwidth (relative width) introduced; align='edge' changed to center of bin - MM

**2008-05-22**

Added support for ReST-based documentation using Sphinx. Documents are located in doc/, and are broken up into a users guide and an API reference. To build, run the make.py files. Sphinx-0.4 is needed to build generate xml, which will be useful for rendering equations with mathml, use sphinx from svn until 0.4 is released - DSD

**2008-05-21**

Fix segfault in TkAgg backend - MGD

**2008-05-21**

Fix a "local variable unreferenced" bug in plotfile - MM

**2008-05-19**

Fix crash when Windows cannot access the registry to determine font path [Bug 1966974, thanks Patrik Simons] - MGD

**2008-05-16**

removed some unneeded code w/ the python 2.4 requirement. cbook no longer provides compatibility for reversed, enumerate, set or izip. removed lib/subprocess, mpl1, sandbox/units, and the swig code. This stuff should remain on the maintenance branch for archival purposes. JDH

**2008-05-16**

Reorganized examples dir - JDH

**2008-05-16**

Added 'elinewidth' keyword arg to errorbar, based on patch by Christopher Brown - MM

**2008-05-16**

Added 'cumulative' keyword arg to hist to plot cumulative histograms. For normed hists, this is normalized to one - MM

**2008-05-15**

Fix Tk backend segfault on some machines - MGD

**2008-05-14**

Don't use stat on Windows (fixes font embedding problem) - MGD

**2008-05-09**

Fix /singlequote (') in Postscript backend - MGD

**2008-05-08**

Fix kerning in SVG when embedding character outlines - MGD

**2008-05-07**

Switched to future numpy histogram semantic in hist - MM

**2008-05-06**

Fix strange colors when blitting in QtAgg and Qt4Agg - MGD

**2008-05-05**

pass notify_axes_change to the figure's add_axobserver in the qt backends, like we do for the other backends. Thanks Glenn Jones for the report - DSD

**2008-05-02**

Added step histograms, based on patch by Erik Tollerud. - MM

**2008-05-02**

On PyQt <= 3.14 there is no way to determine the underlying Qt version. [1851364] - MGD

**2008-05-02**

Don't call sys.exit() when pyemf is not found [1924199] - MGD

**2008-05-02**

Update _subprocess.c from upstream Python 2.5.2 to get a few memory and reference-counting-related bugfixes. See bug 1949978. - MGD

**2008-04-30**

Added some record array editing widgets for gtk -- see examples/rec_edit*.py - JDH

**2008-04-29**

Fix bug in mlab.sqrtm - MM

**2008-04-28**

Fix bug in SVG text with Mozilla-based viewers (the symbol tag is not supported) - MGD

**2008-04-27**

Applied patch by Michiel de Hoon to add hexbin axes method and pyplot function - EF

**2008-04-25**

Enforce python >= 2.4; remove subprocess build - EF

**2008-04-25**

Enforce the numpy requirement at build time - JDH

**2008-04-24**

Make numpy 1.1 and python 2.3 required when importing matplotlib - EF

**2008-04-24**

Fix compilation issues on VS2003 (Thanks Martin Spacek for all the help) - MGD

**2008-04-24**

Fix sub/superscripts when the size of the font has been changed - MGD

**2008-04-22**

Use "svg.embed_char_paths" consistently everywhere - MGD

**2008-04-20**

Add support to MaxNLocator for symmetric axis autoscaling. - EF

**2008-04-20**

Fix double-zoom bug. - MM

**2008-04-15**

Speed up colormapping. - EF

**2008-04-12**

Speed up zooming and panning of dense images. - EF

**2008-04-11**

Fix global font rcParam setting after initialization time. - MGD

**2008-04-11**

Revert commits 5002 and 5031, which were intended to avoid an unnecessary call to draw(). 5002 broke saving figures before show(). 5031 fixed the problem created in 5002, but broke interactive plotting. Unnecessary call to draw still needs resolution - DSD

**2008-04-07**

Improve color validation in rc handling, suggested by Lev Givon - EF

**2008-04-02**

Allow to use both linestyle definition arguments, '-' and 'solid' etc. in plots/collections - MM

**2008-03-27**

Fix saving to Unicode filenames with Agg backend (other backends appear to already work...) (Thanks, Christopher Barker) - MGD

**2008-03-26**

Fix SVG backend bug that prevents copying and pasting in Inkscape (thanks Kaushik Ghose) - MGD

**2008-03-24**

Removed an unnecessary call to draw() in the backend_qt* mouseReleaseEvent. Thanks to Ted Drain - DSD

**2008-03-23**

Fix a pdf backend bug which sometimes caused the outermost gsave to not be balanced with a grestore. - JKS

**2008-03-20**

Fixed a minor bug in ContourSet._process_linestyles when len(linestyles)==Nlev - MM

**2008-03-19**

Changed ma import statements to "from numpy import ma"; this should work with past and future versions of numpy, whereas "import numpy.ma as ma" will work only with numpy >= 1.05, and "import numerix.npyma as ma" is obsolete now that maskedarray is replacing the earlier implementation, as of numpy 1.05.

**2008-03-14**

Removed an apparently unnecessary call to FigureCanvasAgg.draw in backend_qt*agg. Thanks to Ted Drain - DSD

**2008-03-10**

Workaround a bug in backend_qt4agg's blitting due to a buffer width/bbox width mismatch in _backend_agg's copy_from_bbox - DSD

**2008-02-29**

Fix class Wx toolbar pan and zoom functions (Thanks Jeff Peery) - MGD

**2008-02-16**

Added some new rec array functionality to mlab (rec_summarize, rec2txt and rec_groupby). See examples/rec_groupby_demo.py. Thanks to Tim M for rec2txt.

**2008-02-12**

Applied Erik Tollerud's span selector patch - JDH

**2008-02-11**

Update plotting() doc string to refer to getp/setp. - JKS

**2008-02-10**

Fixed a problem with square roots in the pdf backend with usetex. - JKS

**2008-02-08**

Fixed minor __str__ bugs so getp(gca()) works. - JKS

**2008-02-05**

Added getters for title, xlabel, ylabel, as requested by Brandon Kieth - EF

**2008-02-05**

Applied Gael's ginput patch and created examples/ginput_demo.py - JDH

**2008-02-03**

Expose interpnames, a list of valid interpolation methods, as an AxesImage class attribute. - EF

**2008-02-03**

Added BoundaryNorm, with examples in colorbar_only.py and image_masked.py. - EF

**2008-02-03**

Force dpi=72 in pdf backend to fix picture size bug. - JKS

**2008-02-01**

Fix doubly-included font problem in Postscript backend - MGD

**2008-02-01**

Fix reference leak in ft2font Glyph objects. - MGD

**2008-01-31**

Don't use unicode strings with usetex by default - DSD

**2008-01-31**

Fix text spacing problems in PDF backend with *some* fonts, such as STIXGeneral.

**2008-01-31**

Fix sqrt with radical number (broken by making [ and ] work below) - MGD

**2008-01-27**

Applied Martin Teichmann's patch to improve the Qt4 backend. Uses Qt's builtin toolbars and statusbars. See bug 1828848 - DSD

**2008-01-10**

Moved toolkits to mpl_toolkits, made mpl_toolkits a namespace package - JSWHIT

**2008-01-10**

Use setup.cfg to set the default parameters (tkagg, numpy) when building windows installers - DSD

**2008-01-10**

Fix bug displaying [ and ] in mathtext - MGD

**2008-01-10**

Fix bug when displaying a tick value offset with scientific notation. (Manifests itself as a warning that the times symbol cannot be found). - MGD

**2008-01-10**

Use setup.cfg to set the default parameters (tkagg, numpy) when building windows installers - DSD

---

**2008-01-06**

Released 0.91.2 at revision 4802

**2007-12-26**

Reduce too-late use of matplotlib.use() to a warning instead of an exception, for backwards compatibility - EF

**2007-12-25**

Fix bug in errorbar, identified by Noriko Minakawa - EF

**2007-12-25**

Changed masked array importing to work with the upcoming numpy 1.05 (now the maskedarray branch) as well as with earlier versions. - EF

**2007-12-16**

rec2csv saves doubles without losing precision. Also, it does not close filehandles passed in open. - JDH,ADS

**2007-12-13**

Moved rec2gtk to matplotlib.toolkits.gtktools and rec2excel to matplotlib.toolkits.exceltools - JDH

**2007-12-12**

Support alpha-blended text in the Agg and Svg backends - MGD

**2007-12-10**

Fix SVG text rendering bug. - MGD

**2007-12-10**

Increase accuracy of circle and ellipse drawing by using an 8-piece bezier approximation, rather than a 4-piece one. Fix PDF, SVG and Cairo backends so they can draw paths (meaning ellipses as well). - MGD

**2007-12-07**

Issue a warning when drawing an image on a non-linear axis. - MGD

**2007-12-06**

let widgets.Cursor initialize to the lower x and y bounds rather than 0,0, which can cause havoc for dates and other transforms - DSD

**2007-12-06**

updated references to mpl data directories for py2exe - DSD

**2007-12-06**

fixed a bug in rcsetup, see bug 1845057 - DSD

**2007-12-05**

Fix how fonts are cached to avoid loading the same one multiple times. (This was a regression since 0.90 caused by the refactoring of font_manager.py) - MGD

**2007-12-05**

Support arbitrary rotation of usetex text in Agg backend. - MGD

**2007-12-04**

Support '|' as a character in mathtext - MGD

---

**2007-11-27**

Released 0.91.1 at revision 4517

---

**2007-11-27**

Released 0.91.0 at revision 4478

**2007-11-13**

All backends now support writing to a file-like object, not just a regular file. savefig() can be passed a file-like object in place of a file path. - MGD

**2007-11-13**

Improved the default backend selection at build time: SVG -> Agg -> TkAgg -> WXAgg -> GTK -> GTKAgg. The last usable backend in this progression will be chosen in the default config file. If a backend is defined in setup.cfg, that will be the default backend - DSD

**2007-11-13**

Improved creation of default config files at build time for traited config package - DSD

**2007-11-12**

Exposed all the build options in setup.cfg. These options are read into a dict called "options" by setupext.py. Also, added "-mpl" tags to the version strings for packages provided by matplotlib. Versions provided by mpl will be identified and updated on subsequent installs - DSD

**2007-11-12**

Added support for STIX fonts. A new rcParam, mathtext.fontset, can be used to choose between:

**'cm'**

The TeX/LaTeX Computer Modern fonts

**'stix'**

The STIX fonts (see stixfonts.org)

**'stixsans'**

The STIX fonts, using sans-serif glyphs by default

**'custom'**

A generic Unicode font, in which case the mathtext font must be specified using mathtext.bf, mathtext.it, mathtext.sf etc.

Added a new example, stix_fonts_demo.py to show how to access different fonts and unusual symbols. - MGD

**2007-11-12**

Options to disable building backend extension modules moved from setup.py to setup.cfg - DSD

**2007-11-09**

Applied Martin Teichmann's patch 1828813: a QPainter is used in paintEvent, which has to be destroyed using the method end(). If matplotlib raises an exception before the call to end - and it does if you feed it with bad data - this method end() is never called and Qt4 will start spitting error messages

**2007-11-09**

Moved pyparsing back into matplotlib namespace. Don't use system pyparsing, API is too variable from one release to the next - DSD

**2007-11-08**

Made pylab use straight numpy instead of oldnumeric by default - EF

**2007-11-08**

Added additional record array utilities to mlab (rec2excel, rec2gtk, rec_join, rec_append_field, rec_drop_field) - JDH

**2007-11-08**

Updated pytz to version 2007g - DSD

**2007-11-08**

Updated pyparsing to version 1.4.8 - DSD

**2007-11-08**

Moved csv2rec to recutils and added other record array utilities - JDH

**2007-11-08**

If available, use existing pyparsing installation - DSD

**2007-11-07**

Removed old enthought.traits from lib/matplotlib, added Gael Varoquaux's enthought.traits-2.6b1, which is stripped of setuptools. The package is installed to site-packages if not already available - DSD

**2007-11-05**

Added easy access to minor tick properties; slight mod of patch by Pierre G-M - EF

**2007-11-02**

Committed Phil Thompson's patch 1599876, fixes to Qt4Agg backend and qt4 blitting demo - DSD

**2007-11-02**

Committed Phil Thompson's patch 1599876, fixes to Qt4Agg backend and qt4 blitting demo - DSD

**2007-10-31**

Made log color scale easier to use with contourf; automatic level generation now works. - EF

**2007-10-29**

TRANSFORMS REFACTORING

The primary goal of this refactoring was to make it easier to extend matplotlib to support new kinds of projections. This is primarily an internal improvement, and the possible user-visible changes it allows are yet to come.

The transformation framework was completely rewritten in Python (with Numpy). This will make it easier to add news kinds of transformations without writing C/C++ code.

Transforms are composed into a 'transform tree', made of transforms whose value depends on other transforms (their children). When the contents of children change, their parents are automatically updated to reflect those changes. To do this an "invalidation" method is used: when children change, all of their ancestors are marked as "invalid". When the value of a transform is accessed at a later time, its value is recomputed only if it is invalid, otherwise a cached value may be used. This prevents unnecessary recomputations of transforms, and contributes to better interactive performance.

The framework can be used for both affine and non-affine transformations. However, for speed, we want use the backend renderers to perform affine transformations whenever possible. Therefore, it is possible to perform just the affine or non-affine part of a transformation on a set of data. The affine is always assumed to occur after the non-affine. For any transform:

```
full transform == non-affine + affine
```

Much of the drawing has been refactored in terms of compound paths. Therefore, many methods have been removed from the backend interface and replaced with a handful to draw compound paths. This will make updating the backends easier, since there is less to update. It also should make the backends more consistent in terms of functionality.

User visible changes:

- POLAR PLOTS: Polar plots are now interactively zoomable, and the r-axis labels can be interactively rotated. Straight line segments are now interpolated to follow the curve of the r-axis.
- Non-rectangular clipping works in more backends and with more types of objects.
- Sharing an axis across figures is now done in exactly the same way as sharing an axis between two axes in the same figure:

```
fig1 = figure()
fig2 = figure()

ax1 = fig1.add_subplot(111)
ax2 = fig2.add_subplot(111, sharex=ax1, sharey=ax1)
```

- linestyles now include steps-pre, steps-post and steps-mid. The old step still works and is equivalent to step-pre.
- Multiple line styles may be provided to a collection.

See API_CHANGES for more low-level information about this refactoring.

**2007-10-24**

Added ax kwarg to Figure.colorbar and pyplot.colorbar - EF

**2007-10-19**

Removed a gsave/grestore pair surrounding _draw_ps, which was causing a loss graphics state info (see "EPS output problem - scatter & edgecolors" on mpl-dev, 2007-10-29) - DSD

**2007-10-15**

Fixed a bug in patches.Ellipse that was broken for aspect='auto'. Scale free ellipses now work properly for equal and auto on Agg and PS, and they fall back on a polygonal approximation for nonlinear transformations until we convince ourselves that the spline approximation holds for nonlinear transformations. Added unit/ellipse_compare.py to compare spline with vertex approx for both aspects. JDH

**2007-10-05**

remove generator expressions from texmanager and mpltraits. generator expressions are not supported by python-2.3 - DSD

**2007-10-01**

Made matplotlib.use() raise an exception if called after backends has been imported. - EF

**2007-09-30**

Modified update* methods of Bbox and Interval so they work with reversed axes. Prior to this, trying to set the ticks on a reversed axis failed with an uninformative error message. - EF

**2007-09-30**

Applied patches to axes3d to fix index error problem - EF

**2007-09-24**

Applied Eike Welk's patch reported on mpl-dev on 2007-09-22 Fixes a bug with multiple plot windows in the qt backend, ported the changes to backend_qt4 as well - DSD

**2007-09-21**

Changed cbook.reversed to yield the same result as the python reversed builtin - DSD

**2007-09-13**

The usetex support in the pdf backend is more usable now, so I am enabling it. - JKS

**2007-09-12**

Fixed a Axes.bar unit bug - JDH

**2007-09-10**

Made skiprows=1 the default on csv2rec - JDH

**2007-09-09**

Split out the plotting part of pylab and put it in pyplot.py; removed numerix from the remaining pylab.py, which imports everything from pyplot.py. The intention is that apart from cleanups, the result of importing from pylab is nearly unchanged, but there is the new alternative of importing from pyplot to get the state-engine graphics without all the numeric functions. Numpified examples; deleted two that were obsolete; modified some to use pyplot. - EF

**2007-09-08**

Eliminated gd and paint backends - EF

**2007-09-06**

.bmp file format is now longer an alias for .raw

**2007-09-07**

Added clip path support to pdf backend. - JKS

**2007-09-06**

Fixed a bug in the embedding of Type 1 fonts in PDF. Now it doesn't crash Preview.app. - JKS

**2007-09-06**

Refactored image saving code so that all GUI backends can save most image types. See FILETYPES for a matrix of backends and their supported file types. Backend canvases should no longer write their own print_figure() method -- instead they should write a print_xxx method for each filetype they can output and add an entry to their class-scoped filetypes dictionary. - MGD

**2007-09-05**

Fixed Qt version reporting in setupext.py - DSD

**2007-09-04**

Embedding Type 1 fonts in PDF, and thus usetex support via dviread, sort of works. To test, enable it by renaming _draw_tex to draw_tex. - JKS

**2007-09-03**

Added ability of errorbar show limits via caret or arrowhead ends on the bars; patch by Manual Metz. - EF

**2007-09-03**

Created type1font.py, added features to AFM and FT2Font (see API_CHANGES), started work on embedding Type 1 fonts in pdf files. - JKS

**2007-09-02**

Continued work on dviread.py. - JKS

**2007-08-16**

Added a set_extent method to AxesImage, allow data extent to be modified after initial call to imshow - DSD

**2007-08-14**

Fixed a bug in pyqt4 subplots-adjust. Thanks to Xavier Gnata for the report and suggested fix - DSD

**2007-08-13**

Use pickle to cache entire fontManager; change to using font_manager module-level function findfont wrapper for the fontManager.findfont method - EF

**2007-08-11**

Numpification and cleanup of mlab.py and some examples - EF

**2007-08-06**

Removed mathtext2

**2007-07-31**

Refactoring of distutils scripts.

- Will not fail on the entire build if an optional Python package (e.g., Tkinter) is installed but its development headers are not (e.g., tk-devel). Instead, it will continue to build all other extensions.
- Provide an overview at the top of the output to display what dependencies and their versions were found, and (by extension) what will be built.
- Use pkg-config, when available, to find freetype2, since this was broken on Mac OS-X when using MacPorts in a non- standard location.

**2007-07-30**

Reorganized configuration code to work with traited config objects. The new config system is located in the matplotlib.config package, but it is disabled by default. To enable it, set NEWCONFIG=True in matplotlib.__init__.py. The new configuration system will still use the old matplotlibrc files by default. To switch to the experimental, traited configuration, set USE_TRAITED_CONFIG=True in config.__init__.py.

**2007-07-29**

Changed default pcolor shading to flat; added aliases to make collection kwargs agree with setter names, so updating works; related minor cleanups. Removed quiver_classic, scatter_classic, pcolor_classic. - EF

**2007-07-26**

Major rewrite of mathtext.py, using the TeX box layout model.

There is one (known) backward incompatible change. The font commands (cal, rm, it, tt) now behave as TeX does: they are in effect until the next font change command or the end of the grouping. Therefore uses of $cal{R}$ should be changed to ${cal R}$. Alternatively, you may use the new LaTeX-style font commands (mathcal, mathrm, mathit, mathtt) which do affect the following group, e.g., $mathcal{R}$.

Other new features include:

- Math may be interspersed with non-math text. Any text with an even number of $'s (non-escaped) will be sent to the mathtext parser for layout.
- Sub/superscripts are less likely to accidentally overlap.
- Support for sub/superscripts in either order, e.g., $x^i_j$ and $x_j^i$ are equivalent.
- Double sub/superscripts (e.g., $x_i_j$) are considered ambiguous and raise an exception. Use braces to disambiguate.
- $frac{x}{y}$ can be used for displaying fractions.
- $sqrt[3]{x}$ can be used to display the radical symbol with a root number and body.
- $left(frac{x}{y}right)$ may be used to create parentheses and other delimiters that automatically resize to the height of their contents.
- Spacing around operators etc. is now generally more like TeX.
- Added support (and fonts) for boldface (bf) and sans-serif (sf) symbols.
- Log-like function name shortcuts are supported. For example, $sin(x)$ may be used instead of ${rm sin}(x)$
- Limited use of kerning for the easy case (same font)

Behind the scenes, the pyparsing.py module used for doing the math parsing was updated to the latest stable version (1.4.6). A lot of duplicate code was refactored out of the Font classes.

- MGD

**2007-07-19**

completed numpification of most trivial cases - NN

**2007-07-19**

converted non-numpy relicts throughout the code - NN

**2007-07-19**

replaced the Python code in numerix/ by a minimal wrapper around numpy that explicitly mentions all symbols that need to be addressed for further numpification - NN

**2007-07-18**

make usetex respect changes to rcParams. texmanager used to only configure itself when it was created, now it reconfigures when rcParams are changed. Thank you Alexander Schmolck for contributing a patch - DSD

**2007-07-17**

added validation to setting and changing rcParams - DSD

**2007-07-17**

bugfix segfault in transforms module. Thanks Ben North for the patch. - ADS

**2007-07-16**

clean up some code in ticker.ScalarFormatter, use unicode to render multiplication sign in offset ticklabel - DSD

**2007-07-16**

fixed a formatting bug in ticker.ScalarFormatter's scientific notation (10^0 was being rendered as 10 in some cases) - DSD

**2007-07-13**

Add MPL_isfinite64() and MPL_isinf64() for testing doubles in (the now misnamed) MPL_isnan.h. - ADS

**2007-07-13**

The matplotlib._isnan module removed (use numpy.isnan) - ADS

**2007-07-13**

Some minor cleanups in _transforms.cpp - ADS

**2007-07-13**

Removed the rest of the numerix extension code detritus, numpified axes.py, and cleaned up the imports in axes.py - JDH

**2007-07-13**

Added legend.loc as configurable option that could in future default to 'best'. - NN

**2007-07-12**

Bugfixes in mlab.py to coerce inputs into numpy arrays. -ADS

**2007-07-11**

Added linespacing kwarg to text.Text - EF

**2007-07-11**

Added code to store font paths in SVG files. - MGD

**2007-07-10**

Store subset of TTF font as a Type 3 font in PDF files. - MGD

**2007-07-09**

Store subset of TTF font as a Type 3 font in PS files. - MGD

**2007-07-09**

Applied Paul's pick restructure pick and add pickers, sourceforge patch 1749829 - JDH

**2007-07-09**

Applied Allan's draw_lines agg optimization. JDH

**2007-07-08**

Applied Carl Worth's patch to fix cairo draw_arc - SC

**2007-07-07**

fixed bug 1712099: xpdf distiller on windows - DSD

**2007-06-30**

Applied patches to tkagg, gtk, and wx backends to reduce memory leakage. Patches supplied by Mike Droettboom; see tracker numbers 1745400, 1745406, 1745408. Also made unit/memleak_gui.py more flexible with command-line options. - EF

**2007-06-30**

Split defaultParams into separate file rcdefaults (together with validation code). Some heavy refactoring was necessary to do so, but the overall behavior should be the same as before. - NN

**2007-06-27**

Added MPLCONFIGDIR for the default location for mpl data and configuration. useful for some apache installs where HOME is not writable. Tried to clean up the logic in _get_config_dir to support non-writable HOME where are writable HOME/.matplotlib already exists - JDH

**2007-06-27**

Fixed locale bug reported at http://sourceforge.net/tracker/index.php?func=detail&aid=1744154&group_id=80706&a
by adding a cbook.unicode_safe function - JDH

**2007-06-27**

Applied Micheal's tk savefig bugfix described at http://sourceforge.net/tracker/index.php?func=detail&aid=1716732&g
Thanks Michael!

**2007-06-27**

Patch for get_py2exe_datafiles() to work with new directory layout. (Thanks Tocer and also Werner Bruhin.) -ADS

**2007-06-27**

Added a scroll event to the mpl event handling system and implemented it for backends GTK* -- other backend users/developers/maintainers, please add support for your backend. - JDH

**2007-06-25**

Changed default to clip=False in colors.Normalize; modified ColorbarBase for easier colormap display - EF

**2007-06-13**

Added maskedarray option to rc, numerix - EF

**2007-06-11**

Python 2.5 compatibility fix for mlab.py - EF

**2007-06-10**

In matplotlibrc file, use 'dashed' | 'solid' instead of a pair of floats for contour.negative_linestyle - EF

**2007-06-08**

Allow plot and fill fmt string to be any mpl string colorspec - EF

**2007-06-08**

Added gnuplot file plotfile function to pylab -- see examples/plotfile_demo.py - JDH

**2007-06-07**

Disable build of numarray and Numeric extensions for internal MPL use and the numerix layer. - ADS

**2007-06-07**

Added csv2rec to matplotlib.mlab to support automatically converting csv files to record arrays using type introspection, and turned on native datetime support using the new units support in matplotlib.dates. See examples/loadrec.py ! JDH

**2007-06-07**

Simplified internal code of _auto_legend_data - NN

**2007-06-04**

Added labeldistance arg to Axes.pie to control the raidal distance of the wedge labels - JDH

**2007-06-03**

Turned mathtext in SVG into single <text> with multiple <tspan> objects (easier to edit in inkscape). - NN

**2007-06-02**

Released 0.90.1 at revision 3352

**2007-06-02**

Display only meaningful labels when calling legend() without args. - NN

**2007-06-02**

Have errorbar follow the color cycle even if line is not plotted. Suppress plotting of errorbar caps for capsize=0. - NN

**2007-06-02**

Set markers to same alpha value as line. - NN

**2007-06-02**

Fix mathtext position in svg backend. - NN

**2007-06-01**

Deprecate Numeric and numarray for use as numerix. Props to Travis -- job well done. - ADS

**2007-05-18**

Added LaTeX unicode support. Enable with the 'text.latex.unicode' rcParam. This requires the ucs and inputenc LaTeX packages. - ADS

**2007-04-23**

Fixed some problems with polar -- added general polygon clipping to clip the lines and grids to the polar axes. Added support for set_rmax to easily change the maximum radial grid. Added support for polar legend - JDH

**2007-04-16**

Added Figure.autofmt_xdate to handle adjusting the bottom and rotating the tick labels for date plots when the ticks often overlap - JDH

**2007-04-09**

Beginnings of usetex support for pdf backend. -JKS

**2007-04-07**

Fixed legend/LineCollection bug. Added label support to collections. - EF

**2007-04-06**

Removed deprecated support for a float value as a gray-scale; now it must be a string, like '0.5'. Added alpha kwarg to ColorConverter.to_rgba_list. - EF

**2007-04-06**

Fixed rotation of ellipses in pdf backend (sf bug #1690559) -JKS

**2007-04-04**

More matshow tweaks; documentation updates; new method set_bounds() for formatters and locators. - EF

**2007-04-02**

Fixed problem with imshow and matshow of integer arrays; fixed problems with changes to color autoscaling. - EF

**2007-04-01**

Made image color autoscaling work correctly with a tracking colorbar; norm.autoscale now scales unconditionally, while norm.autoscale_None changes only None-valued vmin, vmax. - EF

**2007-03-31**

Added a qt-based subplot-adjustment dialog - DSD

**2007-03-30**

Fixed a bug in backend_qt4, reported on mpl-dev - DSD

**2007-03-26**

Removed colorbar_classic from figure.py; fixed bug in Figure.clear() in which _axobservers was not getting cleared. Modernization and cleanups. - EF

**2007-03-26**

Refactored some of the units support -- units now live in the respective x and y Axis instances. See also API_CHANGES for some alterations to the conversion interface. JDH

**2007-03-25**

Fix masked array handling in quiver.py for numpy. (Numeric and numarray support for masked arrays is broken in other ways when using quiver. I didn't pursue that.) - ADS

**2007-03-23**

Made font_manager.py close opened files. - JKS

**2007-03-22**

Made imshow default extent match matshow - EF

**2007-03-22**

Some more niceties for xcorr -- a maxlags option, normed now works for xcorr as well as axorr, usevlines is supported, and a zero correlation hline is added. See examples/xcorr_demo.py. Thanks Sameer for the patch. - JDH

**2007-03-21**

Axes.vlines and Axes.hlines now create and returns a LineCollection, not a list of lines. This is much faster. The kwarg signature has changed, so consult the docs. Modified Axes.errorbar which uses vlines and hlines. See API_CHANGES; the return signature for these three functions is now different

**2007-03-20**

Refactored units support and added new examples - JDH

**2007-03-19**

Added Mike's units patch - JDH

**2007-03-18**

Matshow as an Axes method; test version matshow1() in pylab; added 'integer' Boolean kwarg to MaxNLocator initializer to force ticks at integer locations. - EF

**2007-03-17**

Preliminary support for clipping to paths agg - JDH

**2007-03-17**

Text.set_text() accepts anything convertible with '%s' - EF

**2007-03-14**

Add masked-array support to hist. - EF

**2007-03-03**

Change barh to take a kwargs dict and pass it to bar. Fixes sf bug #1669506.

**2007-03-02**

Add rc parameter pdf.inheritcolor, which disables all color-setting operations in the pdf backend. The idea is that you include the resulting file in another program and set the colors (both stroke and fill color) there, so you can use the same pdf file for e.g., a paper and a presentation and have them in the surrounding color. You will probably not want to draw figure and axis frames in that case, since they would be filled in the same color. - JKS

**2007-02-26**

Prevent building _wxagg.so with broken Mac OS X wxPython. - ADS

**2007-02-23**

Require setuptools for Python 2.3 - ADS

**2007-02-22**

WXAgg accelerator updates - KM

WXAgg's C++ accelerator has been fixed to use the correct wxBitmap constructor.

The backend has been updated to use new wxPython functionality to provide fast blit() animation without the C++ accelerator. This requires wxPython 2.8 or later. Previous versions of wxPython can use the C++ accelerator or the old pure Python routines.

setup.py no longer builds the C++ accelerator when wxPython >= 2.8 is present.

The blit() method is now faster regardless of which agg/wxPython conversion routines are used.

**2007-02-21**

Applied the PDF backend patch by Nicolas Grilly. This impacts several files and directories in matplotlib:

- Created the directory lib/matplotlib/mpl-data/fonts/pdfcorefonts, holding AFM files for the 14 PDF core fonts. These fonts are embedded in every PDF viewing application.
- setup.py: Added the directory pdfcorefonts to package_data.
- lib/matplotlib/__init__.py: Added the default parameter 'pdf.use14corefonts'. When True, the PDF backend uses only the 14 PDF core fonts.
- lib/matplotlib/afm.py: Added some keywords found in recent AFM files. Added a little workaround to handle Euro symbol.
- lib/matplotlib/fontmanager.py: Added support for the 14 PDF core fonts. These fonts have a dedicated cache (file pdfcorefont.cache), not the same as for other AFM files (file .afmfont.cache). Also cleaned comments to conform to CODING_GUIDE.
- lib/matplotlib/backends/backend_pdf.py: Added support for 14 PDF core fonts. Fixed some issues with incorrect character widths and encodings (works only for the most common encoding, WinAnsiEncoding, defined by the official PDF Reference). Removed parameter 'dpi' because it causes alignment issues.

-JKS (patch by Nicolas Grilly)

**2007-02-17**

Changed ft2font.get_charmap, and updated all the files where get_charmap is mentioned - ES

**2007-02-13**

Added barcode demo- JDH

**2007-02-13**

Added binary colormap to cm - JDH

**2007-02-13**

Added twiny to pylab - JDH

**2007-02-12**

Moved data files into lib/matplotlib so that setuptools' develop mode works. Re-organized the mpl-data layout so that this source structure is maintained in the installation. (i.e., the 'fonts' and 'images' sub-directories are maintained in site-packages.) Suggest removing site-packages/matplotlib/mpl-data and ~/.matplotlib/ttffont.cache before installing - ADS

**2007-02-07**

Committed Rob Hetland's patch for qt4: remove references to text()/latin1(), plus some improvements to the toolbar layout - DSD

---

**2007-02-06**

Released 0.90.0 at revision 3003

**2007-01-22**

Extended the new picker API to text, patches and patch collections. Added support for user customizable pick hit testing and attribute tagging of the PickEvent - Details and examples in examples/pick_event_demo.py - JDH

**2007-01-16**

Begun work on a new pick API using the mpl event handling framework. Artists will define their own pick method with a configurable epsilon tolerance and return pick attrs. All artists that meet the tolerance threshold will fire a PickEvent with artist dependent attrs; e.g., a Line2D can set the indices attribute that shows the indices into the line that are within epsilon of the pick point. See examples/pick_event_demo.py. The implementation of pick for the remaining Artists remains to be done, but the core infrastructure at the level of event handling is in place with a proof-of-concept implementation for Line2D - JDH

**2007-01-16**

src/_image.cpp: update to use Py_ssize_t (for 64-bit systems). Use return value of fread() to prevent warning messages - SC.

**2007-01-15**

src/_image.cpp: combine buffer_argb32() and buffer_bgra32() into a new method color_conv(format) - SC

**2007-01-14**

backend_cairo.py: update draw_arc() so that examples/arctest.py looks correct - SC

**2007-01-12**

backend_cairo.py: enable clipping. Update draw_image() so that examples/contour_demo.py looks correct - SC

**2007-01-12**

backend_cairo.py: fix draw_image() so that examples/image_demo.py now looks correct - SC

**2007-01-11**

Added Axes.xcorr and Axes.acorr to plot the cross correlation of x vs. y or the autocorrelation of x. pylab wrappers also provided. See examples/xcorr_demo.py - JDH

**2007-01-10**

Added "Subplot.label_outer" method. It will set the visibility of the ticklabels so that yticklabels are only visible in the first column and xticklabels are only visible in the last row - JDH

**2007-01-02**

Added additional kwarg documentation - JDH

**2006-12-28**

Improved error message for nonpositive input to log transform; added log kwarg to bar, barh, and hist, and modified bar method to behave sensibly by default when the ordinate has a log scale. (This only works if the log scale is set before or by the call to bar, hence the utility of the log kwarg.) - EF

**2006-12-27**

backend_cairo.py: update draw_image() and _draw_mathtext() to work with numpy - SC

**2006-12-20**

Fixed xpdf dependency check, which was failing on windows. Removed ps2eps dependency check. - DSD

**2006-12-19**

Added Tim Leslie's spectral patch - JDH

**2006-12-17**

Added rc param 'axes.formatter.limits' to control the default threshold for switching to scientific notation. Added convenience method Axes.ticklabel_format() for turning scientific notation on or off on either or both axes. - EF

**2006-12-16**

Added ability to turn control scientific notation in ScalarFormatter - EF

**2006-12-16**

Enhanced boxplot to handle more flexible inputs - EF

**2006-12-13**

Replaced calls to where() in colors.py with much faster clip() and putmask() calls; removed inappropriate uses of getmaskorNone (which should be needed only very rarely); all in response to profiling by David Cournapeau. Also fixed bugs in my 2-D array support from 12-09. - EF

**2006-12-09**

Replaced spy and spy2 with the new spy that combines marker and image capabilities - EF

**2006-12-09**

Added support for plotting 2-D arrays with plot: columns are plotted as in Matlab - EF

**2006-12-09**

Added linewidth kwarg to bar and barh; fixed arg checking bugs - EF

**2006-12-07**

Made pcolormesh argument handling match pcolor; fixed kwarg handling problem noted by Pierre GM - EF

**2006-12-06**

Made pcolor support vector X and/or Y instead of requiring 2-D arrays - EF

**2006-12-05**

Made the default Artist._transform None (rather than invoking identity_transform for each artist only to have it overridden later). Use artist.get_transform() rather than artist._transform, even in derived classes, so that the default transform will be created lazily as needed - JDH

**2006-12-03**

Added LogNorm to colors.py as illustrated by examples/pcolor_log.py, based on suggestion by Jim McDonald. Colorbar modified to handle LogNorm. Norms have additional "inverse" method. - EF

**2006-12-02**

Changed class names in colors.py to match convention: normalize -> Normalize, no_norm -> NoNorm. Old names are still available. Changed __init__.py rc defaults to match those in matplotlibrc - EF

**2006-11-22**

Fixed bug in set_*lim that I had introduced on 11-15 - EF

**2006-11-22**

Added examples/clippedline.py, which shows how to clip line data based on view limits -- it also changes the marker style when zoomed in - JDH

**2006-11-21**

Some spy bug-fixes and added precision arg per Robert C's suggestion - JDH

**2006-11-19**

Added semi-automatic docstring generation detailing all the kwargs that functions take using the artist introspection tools; e.g., 'help text now details the scatter kwargs that control the Text properties - JDH

**2006-11-17**

Removed obsolete scatter_classic, leaving a stub to raise NotImplementedError; same for pcolor_classic - EF

**2006-11-15**

Removed obsolete pcolor_classic - EF

**2006-11-15**

Fixed 1588908 reported by Russel Owen; factored nonsingular method out of ticker.py, put it into transforms.py as a function, and used it in set_xlim and set_ylim. - EF

**2006-11-14**

Applied patch 1591716 by Ulf Larssen to fix a bug in apply_aspect. Modified and applied patch 1594894 by mdehoon to fix bugs and improve formatting in lines.py. Applied patch 1573008 by Greg Willden to make psd etc. plot full frequency range for complex inputs. - EF

**2006-11-14**

Improved the ability of the colorbar to track changes in corresponding image, pcolor, or contourf. - EF

**2006-11-11**

Fixed bug that broke Numeric compatibility; added support for alpha to colorbar. The alpha information is taken from the mappable object, not specified as a kwarg. - EF

**2006-11-05**

Added broken_barh function for making a sequence of horizontal bars broken by gaps -- see examples/broken_barh.py

**2006-11-05**

Removed lineprops and markerprops from the Annotation code and replaced them with an arrow configurable with kwarg arrowprops. See examples/annotation_demo.py - JDH

**2006-11-02**

Fixed a pylab subplot bug that was causing axes to be deleted with hspace or wspace equals zero in subplots_adjust - JDH

**2006-10-31**

Applied axes3d patch 1587359 http://sourceforge.net/tracker/index.php?func=detail&aid=1587359&group_id=80706
JDH

---

**2006-10-26**

Released 0.87.7 at revision 2835

**2006-10-25**

Made "tiny" kwarg in Locator.nonsingular much smaller - EF

**2006-10-17**

Closed sf bug 1562496 update line props dash/solid/cap/join styles - JDH

**2006-10-17**

Complete overhaul of the annotations API and example code - See matplotlib.text.Annotation and examples/annotation_demo.py JDH

**2006-10-12**

Committed Manuel Metz's StarPolygon code and examples/scatter_star_poly.py - JDH

**2006-10-11**

commented out all default values in matplotlibrc.template Default values should generally be taken from defaultParam in __init__.py - the file matplotlib should only contain those values that the user wants to explicitly change from the default. (see thread "marker color handling" on matplotlib-devel)

**2006-10-10**

Changed default comment character for load to '#' - JDH

**2006-10-10**

deactivated rcfile-configurability of markerfacecolor and markeredgecolor. Both are now hardcoded to the special value 'auto' to follow the line color. Configurability at run-time (using function arguments) remains functional. - NN

**2006-10-07**

introduced dummy argument magnification=1.0 to FigImage.make_image to satisfy unit test figimage_demo.py The argument is not yet handled correctly, which should only show up when using non-standard DPI settings in PS backend, introduced by patch #1562394. - NN

**2006-10-06**

add backend-agnostic example: simple3d.py - NN

**2006-09-29**

fix line-breaking for SVG-inline images (purely cosmetic) - NN

**2006-09-29**

reworked set_linestyle and set_marker markeredgecolor and markerfacecolor now default to a special value "auto" that keeps the color in sync with the line color further, the intelligence of axes.plot is cleaned up, improved and simplified. Complete compatibility cannot be guaranteed, but the new behavior should be much more predictable (see patch #1104615 for details) - NN

**2006-09-29**

changed implementation of clip-path in SVG to work around a limitation in inkscape - NN

**2006-09-29**

added two options to matplotlibrc:

- svg.image_inline
- svg.image_noscale

see patch #1533010 for details - NN

**2006-09-29**

axes.py: cleaned up kwargs checking - NN

**2006-09-29**

setup.py: cleaned up setup logic - NN

**2006-09-29**

setup.py: check for required pygtk versions, fixes bug #1460783 - SC

---

**2006-09-27**

Released 0.87.6 at revision 2783

**2006-09-24**

Added line pointers to the Annotation code, and a pylab interface. See matplotlib.text.Annotation, examples/annotation_demo.py and examples/annotation_demo_pylab.py - JDH

**2006-09-18**

mathtext2.py: The SVG backend now supports the same things that the AGG backend does. Fixed some bugs with rendering, and out of bounds errors in the AGG backend - ES. Changed the return values of math_parse_s_ft2font_svg to support lines (fractions etc.)

**2006-09-17**

Added an Annotation class to facilitate annotating objects and an examples file examples/annotation_demo.py. I want to add dash support as in TextWithDash, but haven't decided yet whether inheriting from TextWithDash is the right base class or if another approach is needed - JDH

---

**2006-09-05**

Released 0.87.5 at revision 2761

**2006-09-04**

Added nxutils for some numeric add-on extension code -- specifically a better/more efficient inside polygon tester (see unit/inside_poly_*.py) - JDH

**2006-09-04**

Made bitstream fonts the rc default - JDH

**2006-08-31**

Fixed alpha-handling bug in ColorConverter, affecting collections in general and contour/contourf in particular. - EF

**2006-08-30**

ft2font.cpp: Added draw_rect_filled method (now used by mathtext2 to draw the fraction bar) to FT2Font - ES

**2006-08-29**

setupext.py: wrap calls to tk.getvar() with str(). On some systems, getvar returns a Tcl_Obj instead of a string - DSD

**2006-08-28**

mathtext2.py: Sub/superscripts can now be complex (i.e. fractions etc.). The demo is also updated - ES

**2006-08-28**

font_manager.py: Added /usr/local/share/fonts to list of X11 font directories - DSD

**2006-08-28**

mathtext2.py: Initial support for complex fractions. Also, rendering is now completely separated from parsing. The sub/superscripts now work better. Updated the mathtext2_demo.py - ES

**2006-08-27**

qt backends: don't create a QApplication when backend is imported, do it when the FigureCanvasQt is created. Simplifies applications where mpl is embedded in qt. Updated embedding_in_qt* examples - DSD

**2006-08-27**

mathtext2.py: Now the fonts are searched in the OS font dir and in the mpl-data dir. Also env is not a dict anymore. - ES

**2006-08-26**

minor changes to __init__.py, mathtex2_demo.py. Added matplotlibrc key "mathtext.mathtext2" (removed the key "mathtext2") - ES

**2006-08-21**

mathtext2.py: Initial support for fractions Updated the mathtext2_demo.py _mathtext_data.py: removed "" from the unicode dicts mathtext.py: Minor modification (because of _mathtext_data.py)- ES

**2006-08-20**

Added mathtext2.py: Replacement for mathtext.py. Supports _ ^, rm, cal etc., sin, cos etc., unicode, recursive nestings, inline math mode. The only backend currently supported is Agg __init__.py: added new rc params for mathtext2 added mathtext2_demo.py example - ES

**2006-08-19**

Added embedding_in_qt4.py example - DSD

**2006-08-11**

Added scale free Ellipse patch for Agg - CM

**2006-08-10**

Added converters to and from julian dates to matplotlib.dates (num2julian and julian2num) - JDH

**2006-08-08**

Fixed widget locking so multiple widgets could share the event handling - JDH

**2006-08-07**

Added scale free Ellipse patch to SVG and PS - CM

**2006-08-05**

Re-organized imports in numerix for numpy 1.0b2 -- TEO

**2006-08-04**

Added draw_markers to PDF backend. - JKS

**2006-08-01**

Fixed a bug in postscript's rendering of dashed lines - DSD

**2006-08-01**

figure.py: savefig() update docstring to add support for 'format' argument. backend_cairo.py: print_figure() add support 'format' argument. - SC

**2006-07-31**

Don't let postscript's xpdf distiller compress images - DSD

**2006-07-31**

Added shallowcopy() methods to all Transformations; removed copy_bbox_transform and copy_bbox_transform_shallow from transforms.py; added offset_copy() function to transforms.py to facilitate positioning artists with offsets. See examples/transoffset.py. - EF

**2006-07-31**

Don't let postscript's xpdf distiller compress images - DSD

**2006-07-29**

Fixed numerix polygon bug reported by Nick Fotopoulos. Added inverse_numerix_xy() transform method. Made autoscale_view() preserve axis direction (e.g., increasing down).- EF

**2006-07-28**

Added shallow bbox copy routine for transforms -- mainly useful for copying transforms to apply offset to. - JDH

**2006-07-28**

Added resize method to FigureManager class for Qt and Gtk backend - CM

**2006-07-28**

Added subplots_adjust button to Qt backend - CM

**2006-07-26**

Use numerix more in collections. Quiver now handles masked arrays. - EF

**2006-07-22**

Fixed bug #1209354 - DSD

**2006-07-22**

make scatter() work with the kwarg "color". Closes bug 1285750 - DSD

**2006-07-20**

backend_cairo.py: require pycairo 1.2.0. print_figure() update to output SVG using cairo.

**2006-07-19**

Added blitting for Qt4Agg - CM

**2006-07-19**

Added lasso widget and example examples/lasso_demo.py - JDH

**2006-07-18**

Added blitting for QtAgg backend - CM

**2006-07-17**

Fixed bug #1523585: skip nans in semilog plots - DSD

**2006-07-12**

Add support to render the scientific notation label over the right-side y-axis - DSD

---

**2006-07-11**

Released 0.87.4 at revision 2558

**2006-07-07**

Fixed a usetex bug with older versions of latex - DSD

**2006-07-07**

Add compatibility for NumPy 1.0 - TEO

**2006-06-29**

Added a Qt4Agg backend. Thank you James Amundson - DSD

**2006-06-26**

Fixed a usetex bug. On Windows, usetex will process postscript output in the current directory rather than in a temp directory. This is due to the use of spaces and tildes in windows paths, which cause problems with latex. The subprocess module is no longer used. - DSD

**2006-06-22**

Various changes to bar(), barh(), and hist(). Added 'edgecolor' keyword arg to bar() and barh(). The x and y args in barh() have been renamed to width and bottom respectively, and their order has been swapped to maintain a (position, value) order ala matlab. left, height, width and bottom args can now all be scalars or sequences. barh() now defaults to edge alignment instead of center alignment. Added a keyword arg 'align' to bar(), barh() and hist() that controls between edge or center bar alignment. Fixed ignoring the rcParams['patch.facecolor'] for bar color in bar() and barh(). Fixed ignoring the rcParams['lines.color'] for error bar color in bar() and barh(). Fixed a bug where patches would be cleared when error bars were plotted if rcParams['axes.hold'] was False. - MAS

**2006-06-22**

Added support for numerix 2-D arrays as alternatives to a sequence of (x,y) tuples for specifying paths in collections, quiver, contour, pcolor, transforms. Fixed contour bug involving setting limits for colormapping. Added numpy-style all() to numerix. - EF

**2006-06-20**

Added custom FigureClass hook to pylab interface - see examples/custom_figure_class.py

**2006-06-16**

Added colormaps from gist (gist_earth, gist_stern, gist_rainbow, gist_gray, gist_yarg, gist_heat, gist_ncar) - JW

**2006-06-16**

Added a pointer to parent in figure canvas so you can access the container with fig.canvas.manager. Useful if you want to set the window title, e.g., in gtk fig.canvas.manager.window.set_title, though a GUI neutral method would be preferable JDH

**2006-06-16**

Fixed colorbar.py to handle indexed colors (i.e., norm = no_norm()) by centering each colored region on its index. - EF

**2006-06-15**

Added scalex and scaley to Axes.autoscale_view to support selective autoscaling just the x or y axis, and supported these command in plot so you can say plot(something, scaley=False) and just the x axis will be autoscaled. Modified axvline and axhline to support this, so for example axvline will no longer autoscale the y axis. JDH

**2006-06-13**

Fix so numpy updates are backward compatible - TEO

**2006-06-12**

Updated numerix to handle numpy restructuring of oldnumeric - TEO

**2006-06-12**

Updated numerix.fft to handle numpy restructuring Added ImportError to numerix.linear_algebra for numpy -TEO

**2006-06-11**

Added quiverkey command to pylab and Axes, using QuiverKey class in quiver.py. Changed pylab and Axes to use quiver2 if possible, but drop back to the newly-renamed quiver_classic if necessary. Modified examples/quiver_demo.py to illustrate the new quiver and quiverkey. Changed LineCollection implementation slightly to improve compatibility with PolyCollection. - EF

**2006-06-11**

Fixed a usetex bug for windows, running latex on files with spaces in their names or paths was failing - DSD

**2006-06-09**

Made additions to numerix, changes to quiver to make it work with all numeric flavors. - EF

**2006-06-09**

Added quiver2 function to pylab and method to axes, with implementation via a Quiver class in quiver.py. quiver2 will replace quiver before the next release; it is placed alongside it initially to facilitate testing and transition. See also examples/quiver2_demo.py. - EF

**2006-06-08**

Minor bug fix to make ticker.py draw proper minus signs with usetex - DSD

**2006-06-06**

Released 0.87.3 at revision 2432

**2006-05-30**

More partial support for polygons with outline or fill, but not both. Made LineCollection inherit from ScalarMappable. - EF

**2006-05-29**

Yet another revision of aspect-ratio handling. - EF

**2006-05-27**

Committed a patch to prevent stroking zero-width lines in the svg backend - DSD

**2006-05-24**

Fixed colorbar positioning bug identified by Helge Avlesen, and improved the algorithm; added a 'pad' kwarg to control the spacing between colorbar and parent axes. - EF

**2006-05-23**

Changed color handling so that collection initializers can take any mpl color arg or sequence of args; deprecated float as grayscale, replaced by string representation of float. - EF

**2006-05-19**

Fixed bug: plot failed if all points were masked - EF

**2006-05-19**

Added custom symbol option to scatter - JDH

**2006-05-18**

New example, multi_image.py; colorbar fixed to show offset text when the ScalarFormatter is used; FixedFormatter augmented to accept and display offset text. - EF

**2006-05-14**

New colorbar; old one is renamed to colorbar_classic. New colorbar code is in colorbar.py, with wrappers in figure.py and pylab.py. Fixed aspect-handling bug reported by Michael Mossey. Made backend_bases.draw_quad_mesh() run.- EF

**2006-05-08**

Changed handling of end ranges in contourf: replaced "clip-ends" kwarg with "extend". See docstring for details. -EF

**2006-05-08**

Added axisbelow to rc - JDH

**2006-05-08**

If using PyGTK require version 2.2+ - SC

**2006-04-19**

Added compression support to PDF backend, controlled by new pdf.compression rc setting. - JKS

**2006-04-19**

Added Jouni's PDF backend

**2006-04-18**

Fixed a bug that caused agg to not render long lines

**2006-04-16**

Masked array support for pcolormesh; made pcolormesh support the same combinations of X,Y,C dimensions as pcolor does; improved (I hope) description of grid used in pcolor, pcolormesh. - EF

**2006-04-14**

Reorganized axes.py - EF

**2006-04-13**

Fixed a bug Ryan found using usetex with sans-serif fonts and exponential tick labels - DSD

**2006-04-11**

Refactored backend_ps and backend_agg to prevent module-level texmanager imports. Now these imports only occur if text.usetex rc setting is true - DSD

**2006-04-10**

Committed changes required for building mpl on win32 platforms with visual studio. This allows wxpython blitting for fast animations. - CM

**2006-04-10**

Fixed an off-by-one bug in Axes.change_geometry.

**2006-04-10**

Fixed bug in pie charts where wedge wouldn't have label in legend. Submitted by Simon Hildebrandt. - ADS

**2006-05-06**

Usetex makes temporary latex and dvi files in a temporary directory, rather than in the user's current working directory - DSD

**2006-04-05**

Applied Ken's wx deprecation warning patch closing sf patch #1465371 - JDH

**2006-04-05**

Added support for the new API in the postscript backend. Allows values to be masked using nan's, and faster file creation - DSD

**2006-04-05**

Use python's subprocess module for usetex calls to external programs. subprocess catches when they exit abnormally so an error can be raised. - DSD

**2006-04-03**

Fixed the bug in which widgets would not respond to events. This regressed the twinx functionality, so I also updated subplots_adjust to update axes that share an x or y with a subplot instance. - CM

**2006-04-02**

Moved PBox class to transforms and deleted pbox.py; made pylab axis command a thin wrapper for Axes.axis; more tweaks to aspect-ratio handling; fixed Axes.specgram to account for the new imshow default of unit aspect ratio; made contour set the Axes.dataLim. - EF

**2006-03-31**

Fixed the Qt "Underlying C/C++ object deleted" bug. - JRE

**2006-03-31**

Applied Vasily Sulatskov's Qt Navigation Toolbar enhancement. - JRE

**2006-03-31**

Ported Norbert's rewriting of Halldor's stineman_interp algorithm to make it numerix compatible and added code to matplotlib.mlab. See examples/interp_demo.py - JDH

**2006-03-30**

Fixed a bug in aspect ratio handling; blocked potential crashes when panning with button 3; added axis('image') support. - EF

**2006-03-28**

More changes to aspect ratio handling; new PBox class in new file pbox.py to facilitate resizing and repositioning axes; made PolarAxes maintain unit aspect ratio. - EF

**2006-03-23**

Refactored TextWithDash class to inherit from, rather than delegate to, the Text class. Improves object inspection and closes bug # 1357969 - DSD

**2006-03-22**

Improved aspect ratio handling, including pylab interface. Interactive resizing, pan, zoom of images and plots (including panels with a shared axis) should work. Additions and possible refactoring are still likely. - EF

**2006-03-21**

Added another colorbrewer colormap (RdYlBu) - JSWHIT

**2006-03-21**

Fixed tickmarks for logscale plots over very large ranges. Closes bug # 1232920 - DSD

**2006-03-21**

Added Rob Knight's arrow code; see examples/arrow_demo.py - JDH

**2006-03-20**

Added support for masking values with nan's, using ADS's isnan module and the new API. Works for *Agg backends - DSD

**2006-03-20**

Added contour.negative_linestyle rcParam - ADS

**2006-03-20**

Added _isnan extension module to test for nan with Numeric - ADS

**2006-03-17**

Added Paul and Alex's support for faceting with quadmesh in sf patch 1411223 - JDH

**2006-03-17**

Added Charle Twardy's pie patch to support colors=None. Closes sf patch 1387861 - JDH

**2006-03-17**

Applied sophana's patch to support overlapping axes with toolbar navigation by toggling activation with the 'a' key. Closes sf patch 1432252 - JDH

**2006-03-17**

Applied Aarre's linestyle patch for backend EMF; closes sf patch 1449279 - JDH

**2006-03-17**

Applied Jordan Dawe's patch to support kwarg properties for grid lines in the grid command. Closes sf patch 1451661 - JDH

**2006-03-17**

Center postscript output on page when using usetex - DSD

**2006-03-17**

subprocess module built if Python <2.4 even if subprocess can be imported from an egg - ADS

**2006-03-17**

Added _subprocess.c from Python upstream and hopefully enabled building (without breaking) on Windows, although not tested. - ADS

**2006-03-17**

Updated subprocess.py to latest Python upstream and reverted name back to subprocess.py - ADS

**2006-03-16**

Added John Porter's 3D handling code

---

**2006-03-16**

Released 0.87.2 at revision 2150

**2006-03-15**

Fixed bug in MaxNLocator revealed by daigos@infinito.it. The main change is that Locator.nonsingular now adjusts vmin and vmax if they are nearly the same, not just if they are equal. A new kwarg, "tiny", sets the threshold. - EF

**2006-03-14**

Added import of compatibility library for newer numpy linear_algebra - TEO

**2006-03-12**

Extended "load" function to support individual columns and moved "load" and "save" into matplotlib.mlab so they can be used outside of pylab -- see examples/load_converter.py - JDH

**2006-03-12**

Added AutoDateFormatter and AutoDateLocator submitted by James Evans. Try the load_converter.py example for a demo. - ADS

**2006-03-11**

Added subprocess module from python-2.4 - DSD

**2006-03-11**

Fixed landscape orientation support with the usetex option. The backend_ps print_figure method was getting complicated, I added a _print_figure_tex method to maintain some degree of sanity - DSD

**2006-03-11**

Added "papertype" savefig kwarg for setting postscript papersizes. papertype and ps.papersize rc setting can also be set to "auto" to autoscale pagesizes - DSD

**2006-03-09**

Apply P-J's patch to make pstoeps work on windows patch report # 1445612 - DSD

**2006-03-09**

Make backend rc parameter case-insensitive - DSD

**2006-03-07**

Fixed bug in backend_ps related to C0-C6 papersizes, which were causing problems with postscript viewers. Supported page sizes include letter, legal, ledger, A0-A10, and B0-B10 - DSD

---

**2006-03-07**

Released 0.87.1

**2006-03-04**

backend_cairo.py: fix get_rgb() bug reported by Keith Briggs. Require pycairo 1.0.2. Support saving png to file-like objects. - SC

**2006-03-03**

Fixed pcolor handling of vmin, vmax - EF

**2006-03-02**

improve page sizing with usetex with the latex geometry package. Closes bug # 1441629 - DSD

**2006-03-02**

Fixed dpi problem with usetex png output. Accepted a modified version of patch # 1441809 - DSD

**2006-03-01**

Fixed axis('scaled') to deal with case xmax < xmin - JSWHIT

**2006-03-01**

Added reversed colormaps (with '_r' appended to name) - JSWHIT

**2006-02-27**

Improved eps bounding boxes with usetex - DSD

**2006-02-27**

Test svn commit, again!

**2006-02-27**

Fixed two dependency checking bugs related to usetex on Windows - DSD

**2006-02-27**

Made the rc deprecation warnings a little more human readable.

**2006-02-26**

Update the previous gtk.main_quit() bug fix to use gtk.main_level() - SC

**2006-02-24**

Implemented alpha support in contour and contourf - EF

**2006-02-22**

Fixed gtk main quit bug when quit was called before mainloop. - JDH

**2006-02-22**

Small change to colors.py to workaround apparent bug in numpy masked array module - JSWHIT

**2006-02-22**

Fixed bug in ScalarMappable.to_rgba() reported by Ray Jones, and fixed incorrect fix found by Jeff Whitaker - EF

---

**2006-02-22**

Released 0.87

**2006-02-21**

Fixed portrait/landscape orientation in postscript backend - DSD

**2006-02-21**

Fix bug introduced in yesterday's bug fix - SC

**2006-02-20**

backend_gtk.py FigureCanvasGTK.draw(): fix bug reported by David Tremouilles - SC

**2006-02-20**

Remove the "pygtk.require('2.4')" error from examples/embedding_in_gtk2.py - SC

**2006-02-18**

backend_gtk.py FigureCanvasGTK.draw(): simplify to use (rather than duplicate) the expose_event() drawing code - SC

**2006-02-12**

Added stagger or waterfall plot capability to LineCollection; illustrated in examples/collections.py. - EF

**2006-02-11**

Massive cleanup of the usetex code in the postscript backend. Possibly fixed the clipping issue users were reporting with older versions of ghostscript - DSD

**2006-02-11**

Added autolim kwarg to axes.add_collection. Changed collection get_verts() methods accordingly. - EF

**2006-02-09**

added a temporary rc parameter text.dvipnghack, to allow Mac users to get nice results with the usetex option. - DSD

**2006-02-09**

Fixed a bug related to setting font sizes with the usetex option. - DSD

**2006-02-09**

Fixed a bug related to usetex's latex code. - DSD

**2006-02-09**

Modified behavior of font.size rc setting. You should define font.size in pts, which will set the "medium" or default fontsize. Special text sizes like axis labels or tick labels can be given relative font sizes like small, large, x-large, etc. and will scale accordingly. - DSD

**2006-02-08**

Added py2exe specific datapath check again. Also added new py2exe helper function get_py2exe_datafiles for use in py2exe setup.py scripts. - CM

**2006-02-02**

Added box function to pylab

**2006-02-02**

Fixed a problem in setupext.py, tk library formatted in unicode caused build problems - DSD

**2006-02-01**

Dropped TeX engine support in usetex to focus on LaTeX. - DSD

**2006-01-29**

Improved usetex option to respect the serif, sans-serif, monospace, and cursive rc settings. Removed the font.latex.package rc setting, it is no longer required - DSD

**2006-01-29**

Fixed tex's caching to include font.family rc information - DSD

**2006-01-29**

Fixed subpixel rendering bug in *Agg that was causing uneven gridlines - JDH

**2006-01-28**

Added fontcmd to backend_ps's RendererPS.draw_tex, to support other font families in eps output - DSD

**2006-01-28**

Added MaxNLocator to ticker.py, and changed contour.py to use it by default. - EF

**2006-01-28**

Added fontcmd to backend_ps's RendererPS.draw_tex, to support other font families in eps output - DSD

**2006-01-27**

Buffered reading of matplotlibrc parameters in order to allow 'verbose' settings to be processed first (allows verbose.report during rc validation process) - DSD

**2006-01-27**

Removed setuptools support from setup.py and created a separate setupegg.py file to replace it. - CM

**2006-01-26**

Replaced the ugly datapath logic with a cleaner approach from http://wiki.python.org/moin/DistutilsInstallDataScattered. Overrides the install_data command. - CM

**2006-01-24**

Don't use character typecodes in cntr.c --- changed to use defined typenumbers instead. - TEO

**2006-01-24**

Fixed some bugs in usetex's and ps.usedistiller's dependency

**2006-01-24**

Added masked array support to scatter - EF

**2006-01-24**

Fixed some bugs in usetex's and ps.usedistiller's dependency checking - DSD

---

**2006-01-24**

Released 0.86.2

**2006-01-20**

Added a converters dict to pylab load to convert selected columns to float -- especially useful for files with date strings, uses a datestr2num converter - JDH

**2006-01-20**

Added datestr2num to matplotlib dates to convert a string or sequence of strings to a matplotlib datenum

**2006-01-18**

Added quadrilateral pcolormesh patch 1409190 by Alex Mont and Paul Kienzle -- this is *Agg only for now. See examples/quadmesh_demo.py - JDH

**2006-01-18**

Added Jouni's boxplot patch - JDH

**2006-01-18**

Added comma delimiter for pylab save - JDH

**2006-01-12**

Added Ryan's legend patch - JDH

**2006-01-12**

Fixed numpy / numeric to use .dtype.char to keep in SYNC with numpy SVN

---

**2006-01-11**

Released 0.86.1

**2006-01-11**

Fixed setup.py for win32 build and added rc template to the MANIFEST.in

**2006-01-10**

Added xpdf distiller option. matplotlibrc ps.usedistiller can now be none, false, ghostscript, or xpdf. Validation checks for dependencies. This needs testing, but the xpdf option should produce the highest-quality output and small file sizes - DSD

**2006-01-10**

For the usetex option, backend_ps now does all the LaTeX work in the os's temp directory - DSD

**2006-01-10**

Added checks for usetex dependencies. - DSD

---

**2006-01-09**

Released 0.86

**2006-01-04**

Changed to support numpy (new name for scipy_core) - TEO

**2006-01-04**

Added Mark's scaled axes patch for shared axis

**2005-12-28**

Added Chris Barker's build_wxagg patch - JDH

**2005-12-27**

Altered numerix/scipy to support new scipy package structure - TEO

**2005-12-20**

Fixed Jame's Boyles date tick reversal problem - JDH

**2005-12-20**

Added Jouni's rc patch to support lists of keys to set on - JDH

**2005-12-12**

Updated pyparsing and mathtext for some speed enhancements (Thanks Paul McGuire) and minor fixes to scipy numerix and setuptools

**2005-12-12**

Matplotlib data is now installed as package_data in the matplotlib module. This gets rid of checking the many possibilities in matplotlib._get_data_path() - CM

**2005-12-11**

Support for setuptools/pkg_resources to build and use matplotlib as an egg. Still allows matplotlib to exist using a traditional distutils install. - ADS

**2005-12-03**

Modified setup to build matplotlibrc based on compile time findings. It will set numerix in the order of scipy, numarray, Numeric depending on which are founds, and backend as in preference order GTKAgg, WXAgg, TkAgg, GTK, Agg, PS

**2005-12-03**

Modified scipy patch to support Numeric, scipy and numarray Some work remains to be done because some of the scipy imports are broken if only the core is installed. e.g., apparently we need from scipy.basic.fftpack import * rather than from scipy.fftpack import *

**2005-12-03**

Applied some fixes to Nicholas Young's nonuniform image patch

**2005-12-01**

Applied Alex Gontmakher hatch patch - PS only for now

**2005-11-30**

Added Rob McMullen's EMF patch

**2005-11-30**

Added Daishi's patch for scipy

**2005-11-30**

Fixed out of bounds draw markers segfault in agg

**2005-11-28**

Got TkAgg blitting working 100% (cross fingers) correctly. - CM

**2005-11-27**

Multiple changes in cm.py, colors.py, figure.py, image.py, contour.py, contour_demo.py; new _cm.py, examples/image_masked.py.

1. Separated the color table data from cm.py out into a new file, _cm.py, to make it easier to find the actual code in cm.py and to add new colormaps. Also added some line breaks to the color data dictionaries. Everything from _cm.py is imported by cm.py, so the split should be transparent.
2. Enabled automatic generation of a colormap from a list of colors in contour; see modified examples/contour_demo.py.
3. Support for imshow of a masked array, with the ability to specify colors (or no color at all) for masked regions, and for regions that are above or below the normally mapped region. See examples/image_masked.py.
4. In support of the above, added two new classes, ListedColormap, and no_norm, to colors.py, and modified the Colormap class to include common functionality. Added a clip kwarg to the normalize class. Reworked color handling in contour.py, especially in the ContourLabeller mixin.

- EF

**2005-11-25**

Changed text.py to ensure color is hashable. EF

---

**2005-11-16**

Released 0.85

**2005-11-16**

Changed the default linewidth in rc to 1.0

**2005-11-16**

Replaced agg_to_gtk_drawable with pure pygtk pixbuf code in backend_gtkagg. When the equivalent is doe for blit, the agg extension code will no longer be needed

**2005-11-16**

Added a maxdict item to cbook to prevent caches from growing w/o bounds

**2005-11-15**

Fixed a colorup/colordown reversal bug in finance.py -- Thanks Gilles

**2005-11-15**

Applied Jouni K Steppanen's boxplot patch SF patch#1349997 - JDH

**2005-11-09**

added axisbelow attr for Axes to determine whether ticks and such are above or below the actors

**2005-11-08**

Added Nicolas' irregularly spaced image patch

**2005-11-08**

Deprecated HorizontalSpanSelector and replaced with SpanSelection that takes a third arg, direction. The new SpanSelector supports horizontal and vertical span selection, and the appropriate min/max is returned. - CM

**2005-11-08**

Added lineprops dialog for gtk

**2005-11-03**

Added FIFOBuffer class to mlab to support real time feeds and examples/fifo_buffer.py

**2005-11-01**

Contributed Nickolas Young's patch for afm mathtext to support mathtext based upon the standard postscript Symbol font when ps.usetex = True.

**2005-10-26**

Added support for scatter legends - thanks John Gill

**2005-10-20**

Fixed image clipping bug that made some tex labels disappear. JDH

**2005-10-14**

Removed sqrt from dvipng 1.6 alpha channel mask.

**2005-10-14**

Added width kwarg to hist function

**2005-10-10**

Replaced all instances of os.rename with shutil.move

**2005-10-05**

Added Michael Brady's ydate patch

**2005-10-04**

Added rkern's texmanager patch

**2005-09-25**

contour.py modified to use a single ContourSet class that handles filled contours, line contours, and labels; added keyword arg (clip_ends) to contourf. Colorbar modified to work with new ContourSet object; if the ContourSet has lines rather than polygons, the colorbar will follow suit. Fixed a bug introduced in 0.84, in which contourf(...,colors=...) was broken - EF

---

**2005-09-19**

Released 0.84

**2005-09-14**

Added a new 'resize_event' which triggers a callback with a backend_bases.ResizeEvent object - JDH

**2005-09-14**

font_manager.py: removed chkfontpath from x11FontDirectory() - SC

**2005-09-14**

Factored out auto date locator/formatter factory code into matplotlib.date.date_ticker_factory; applies John Bryne's quiver patch.

**2005-09-13**

Added Mark's axes positions history patch #1286915

**2005-09-09**

Added support for auto canvas resizing with:

```
fig.set_figsize_inches(9,5,forward=True) # inches
```

OR:

```
fig.resize(400,300)   # pixels
```

**2005-09-07**

figure.py: update Figure.draw() to use the updated renderer.draw_image() so that examples/figimage_demo.py works again. examples/stock_demo.py: remove data_clipping (which no longer exists) - SC

**2005-09-06**

Added Eric's tick.direction patch: in or out in rc

**2005-09-06**

Added Martin's rectangle selector widget

**2005-09-04**

Fixed a logic err in text.py that was preventing rgxsuper from matching - JDH

**2005-08-29**

Committed Ken's wx blit patch #1275002

**2005-08-26**

colorbar modifications - now uses contourf instead of imshow so that colors used by contourf are displayed correctly. Added two new keyword args (cspacing and clabels) that are only relevant for ContourMappable images - JSWHIT

**2005-08-24**

Fixed a PS image bug reported by Darren - JDH

**2005-08-23**

colors.py: change hex2color() to accept unicode strings as well as normal strings. Use isinstance() instead of types.IntType etc - SC

**2005-08-16**

removed data_clipping line and rc property - JDH

**2005-08-22**

backend_svg.py: Remove redundant "x=0.0 y=0.0" from svg element. Increase svg version from 1.0 to 1.1. Add viewBox attribute to svg element to allow SVG documents to scale-to-fit into an arbitrary viewport - SC

**2005-08-16**

Added Eric's dot marker patch - JDH

**2005-08-08**

Added blitting/animation for TkAgg - CM

**2005-08-05**

Fixed duplicate tickline bug - JDH

**2005-08-05**

Fixed a GTK animation bug that cropped up when doing animations in gtk//gtkagg canvases that had widgets packed above them

**2005-08-05**

Added Clovis Goldemberg patch to the tk save dialog

**2005-08-04**

Removed origin kwarg from backend.draw_image. origin is handled entirely by the frontend now.

**2005-07-03**

Fixed a bug related to TeX commands in backend_ps

**2005-08-03**

Fixed SVG images to respect upper and lower origins.

**2005-08-03**

Added flipud method to image and removed it from to_str.

**2005-07-29**

Modified figure.figaspect to take an array or number; modified backend_svg to write utf-8 - JDH

**2005-07-30**

backend_svg.py: embed png image files in svg rather than linking to a separate png file, fixes bug #1245306 (thanks to Norbert Nemec for the patch) - SC

---

**2005-07-29**

Released 0.83.2

**2005-07-27**

Applied SF patch 1242648: minor rounding error in IndexDateFormatter in dates.py

**2005-07-27**

Applied sf patch 1244732: Scale axis such that circle looks like circle - JDH

**2005-07-29**

Improved message reporting in texmanager and backend_ps - DSD

**2005-07-28**

backend_gtk.py: update FigureCanvasGTK.draw() (needed due to the recent expose_event() change) so that examples/anim.py works in the usual way - SC

**2005-07-26**

Added new widgets Cursor and HorizontalSpanSelector to matplotlib.widgets. See examples/widgets/cursor.py and examples/widgets/span_selector.py - JDH

**2005-07-26**

added draw event to mpl event hierarchy -- triggered on figure.draw

**2005-07-26**

backend_gtk.py: allow 'f' key to toggle window fullscreen mode

**2005-07-26**

backend_svg.py: write "<.../>" elements all on one line and remove surplus spaces - SC

**2005-07-25**

backend_svg.py: simplify code by deleting GraphicsContextSVG and RendererSVG.new_gc(), and moving the gc.get_capstyle() code into RendererSVG._get_gc_props_svg() - SC

**2005-07-24**

backend_gtk.py: call FigureCanvasBase.motion_notify_event() on all motion-notify-events, not just ones where a modifier key or button has been pressed (fixes bug report from Niklas Volbers) - SC

**2005-07-24**

backend_gtk.py: modify print_figure() use own pixmap, fixing problems where print_figure() overwrites the display pixmap. return False from all button/key etc events - to allow the event to propagate further - SC

**2005-07-23**

backend_gtk.py: change expose_event from using set_back_pixmap(); clear() to draw_drawable() - SC

**2005-07-23**

backend_gtk.py: removed pygtk.require() matplotlib/__init__.py: delete 'FROZEN' and 'McPLError' which are no longer used - SC

**2005-07-22**

backend_gdk.py: removed pygtk.require() - SC

**2005-07-21**

backend_svg.py: Remove unused imports. Remove methods doc strings which just duplicate the docs from backend_bases.py. Rename draw_mathtext to _draw_mathtext. - SC

**2005-07-17**

examples/embedding_in_gtk3.py: new example demonstrating placing a FigureCanvas in a gtk.ScrolledWindow - SC

**2005-07-14**

Fixed a Windows related bug (#1238412) in texmanager - DSD

**2005-07-11**

Fixed color kwarg bug, setting color=1 or 0 caused an exception - DSD

**2005-07-07**

Added Eric's MA set_xdata Line2D fix - JDH

**2005-07-06**

Made HOME/.matplotlib the new config dir where the matplotlibrc file, the ttf.cache, and the tex.cache live. The new default filenames in .matplotlib have no leading dot and are not hidden. e.g., the new

names are matplotlibrc tex.cache ttffont.cache. This is how ipython does it so it must be right. If old files are found, a warning is issued and they are moved to the new location. Also fixed texmanager to put all files, including temp files in ~/.matplotlib/tex.cache, which allows you to usetex in non-writable dirs.

**2005-07-05**

Fixed bug #1231611 in subplots adjust layout. The problem was that the text caching mechanism was not using the transformation affine in the key. - JDH

**2005-07-05**

Fixed default backend import problem when using API (SF bug # 1209354 - see API_CHANGES for more info - JDH

**2005-07-04**

backend_gtk.py: require PyGTK version 2.0.0 or higher - SC

**2005-06-30**

setupext.py: added numarray_inc_dirs for building against numarray when not installed in standard location - ADS

**2005-06-27**

backend_svg.py: write figure width, height as int, not float. Update to fix some of the pychecker warnings - SC

**2005-06-23**

Updated examples/agg_test.py to demonstrate curved paths and fills - JDH

**2005-06-21**

Moved some texmanager and backend_agg tex caching to class level rather than instance level - JDH

**2005-06-20**

setupext.py: fix problem where _nc_backend_gdk is installed to the wrong directory - SC

**2005-06-19**

Added 10.4 support for CocoaAgg. - CM

**2005-06-18**

Move Figure.get_width_height() to FigureCanvasBase and return int instead of float. - SC

**2005-06-18**

Applied Ted Drain's QtAgg patch: 1) Changed the toolbar to be a horizontal bar of push buttons instead of a QToolbar and updated the layout algorithms in the main window accordingly. This eliminates the ability to drag and drop the toolbar and detach it from the window. 2) Updated the resize algorithm in the main window to show the correct size for the plot widget as requested. This works almost correctly right now. It looks to me like the final size of the widget is off by the border of the main window but I haven't figured out a way to get that information yet. We could just add a small margin to the new size but that seems a little hacky. 3) Changed the x/y location label to be in the toolbar like the Tk backend instead of as a status line at the bottom of the widget. 4) Changed the toolbar pixmaps to use the ppm

files instead of the png files. I noticed that the Tk backend buttons looked much nicer and it uses the ppm files so I switched them.

**2005-06-17**

Modified the gtk backend to not queue mouse motion events. This allows for live updates when dragging a slider. - CM

**2005-06-17**

Added starter CocoaAgg backend. Only works on OS 10.3 for now and requires PyObjC. (10.4 is high priority) - CM

**2005-06-17**

Upgraded pyparsing and applied Paul McGuire's suggestions for speeding things up. This more than doubles the speed of mathtext in my simple tests. JDH

**2005-06-16**

Applied David Cooke's subplot make_key patch

---

### 0.82 (2005-06-15)

**2005-06-15**

Added subplot config tool to GTK* backends -- note you must now import the NavigationToolbar2 from your backend of choice rather than from backend_gtk because it needs to know about the backend specific canvas -- see examples/embedding_in_gtk2.py. Ditto for wx backend -- see examples/embedding_in_wxagg.py

**2005-06-15**

backend_cairo.py: updated to use pycairo 0.5.0 - SC

**2005-06-14**

Wrote some GUI neutral widgets (Button, Slider, RadioButtons, CheckButtons) in matplotlib.widgets. See examples/widgets/*.py - JDH

**2005-06-14**

Exposed subplot parameters as rc vars and as the fig SubplotParams instance subplotpars. See figure.SubplotParams, figure.Figure.subplots_adjust and the pylab method subplots_adjust and examples/subplots_adjust.py . Also added a GUI neutral widget for adjusting subplots, see examples/subplot_toolbar.py - JDH

**2005-06-13**

Exposed cap and join style for lines with new rc params and line properties:

```
lines.dash_joinstyle : miter        # miter|round|bevel
lines.dash_capstyle : butt          # butt|round|projecting
lines.solid_joinstyle : miter       # miter|round|bevel
lines.solid_capstyle : projecting   # butt|round|projecting
```

**2005-06-13**

Added kwargs to Axes init

**2005-06-13**

Applied Baptiste's tick patch - JDH

**2005-06-13**

Fixed rc alias 'l' bug reported by Fernando by removing aliases for mainlevel rc options. - JDH

**2005-06-10**

Fixed bug #1217637 in ticker.py - DSD

**2005-06-07**

Fixed a bug in texmanager.py: .aux files not being removed - DSD

**2005-06-08**

Added Sean Richard's hist binning fix -- see API_CHANGES - JDH

**2005-06-07**

Fixed a bug in texmanager.py: .aux files not being removed - DSD

---

### 0.81 (2005-06-07)

**2005-06-06**

Added autoscale_on prop to axes

**2005-06-06**

Added Nick's picker "among" patch - JDH

**2005-06-05**

Fixed a TeX/LaTeX font discrepancy in backend_ps. - DSD

**2005-06-05**

Added a ps.distill option in rc settings. If True, postscript output will be distilled using ghostscript, which should trim the file size and allow it to load more quickly. Hopefully this will address the issue of large ps files due to font definitions. Tested with gnu-ghostscript-8.16. - DSD

**2005-06-03**

Improved support for tex handling of text in backend_ps. - DSD

**2005-06-03**

Added rc options to render text with tex or latex, and to select the latex font package. - DSD

**2005-06-03**

Fixed a bug in ticker.py causing a ZeroDivisionError

**2005-06-02**

backend_gtk.py remove DBL_BUFFER, add line to expose_event to try to fix pygtk 2.6 redraw problem - SC

**2005-06-01**

The default behavior of ScalarFormatter now renders scientific notation and large numerical offsets in a label at the end of the axis. - DSD

**2005-06-01**

Added Nicholas' frombyte image patch - JDH

**2005-05-31**

Added vertical TeX support for agg - JDH

**2005-05-31**

Applied Eric's cntr patch - JDH

**2005-05-27**

Finally found the pesky agg bug (which Maxim was kind enough to fix within hours) that was causing a segfault in the win32 cached marker drawing. Now windows users can get the enormous performance benefits of cached markers w/o those occasional pesy screenshots. - JDH

**2005-05-27**

Got win32 build system working again, using a more recent version of gtk and pygtk in the win32 build, gtk 2.6 from https://web.archive.org/web/20050527002647/https://www.gimp.org/~tml/gimp/win32/downloads.html (you will also need libpng12.dll to use these). I haven't tested whether this binary build of mpl for win32 will work with older gtk runtimes, so you may need to upgrade.

**2005-05-27**

Fixed bug where 2nd wxapp could be started if using wxagg backend. - ADS

**2005-05-26**

Added Daishi text with dash patch -- see examples/dashtick.py

**2005-05-26**

Moved backend_latex functionality into backend_ps. If text.usetex=True, the PostScript backend will use LaTeX to generate the .ps or .eps file. Ghostscript is required for eps output. - DSD

**2005-05-24**

Fixed alignment and color issues in latex backend. - DSD

**2005-05-21**

Fixed raster problem for small rasters with dvipng -- looks like it was a premultiplied alpha problem - JDH

**2005-05-20**

Added linewidth and faceted kwarg to scatter to control edgewidth and color. Also added autolegend patch to inspect line segments.

**2005-05-18**

Added Orsay and JPL qt fixes - JDH

**2005-05-17**

Added a psfrag latex backend -- some alignment issues need to be worked out. Run with -dLaTeX and a *.tex file and *.eps file are generated. latex and dvips the generated latex file to get ps output. Note xdvi *does* not work, you must generate ps.- JDH

**2005-05-13**

Added Florent Rougon's Axis set_label1 patch

**2005-05-17**

pcolor optimization, fixed bug in previous pcolor patch - JSWHIT

**2005-05-16**

Added support for masked arrays in pcolor - JSWHIT

**2005-05-12**

Started work on TeX text for antigrain using pngdvi -- see examples/tex_demo.py and the new module matplotlib.texmanager. Rotated text not supported and rendering small glyphs is not working right yet. But large fontsizes and/or high dpi saved figs work great.

**2005-05-10**

New image resize options interpolation options. New values for the interp kwarg are

> 'nearest', 'bilinear', 'bicubic', 'spline16', 'spline36', 'hanning', 'hamming', 'hermite', 'kaiser', 'quadric', 'catrom', 'gaussian', 'bessel', 'mitchell', 'sinc', 'lanczos', 'blackman'

See help(imshow) for details, particularly the interpolation, filternorm and filterrad kwargs

**2005-05-10**

Applied Eric's contour mem leak fixes - JDH

**2005-05-10**

Extended python agg wrapper and started implementing backend_agg2, an agg renderer based on the python wrapper. This will be more flexible and easier to extend than the current backend_agg. See also examples/agg_test.py - JDH

**2005-05-09**

Added Marcin's no legend patch to exclude lines from the autolegend builder:

```
plot(x, y, label='nolegend')
```

**2005-05-05**

Upgraded to agg23

**2005-05-05**

Added newscalarformatter_demo.py to examples. -DSD

**2005-05-04**

Added NewScalarFormatter. Improved formatting of ticklabels, scientific notation, and the ability to plot large numbers with small ranges, by determining a numerical offset. See ticker.NewScalarFormatter for more details. -DSD

**2005-05-03**

Added the option to specify a delimiter in pylab.load -DSD

**2005-04-28**

Added Darren's line collection example

**2005-04-28**

Fixed aa property in agg - JDH

**2005-04-27**

Set postscript page size in .matplotlibrc - DSD

**2005-04-26**

Added embedding in qt example. - JDH

**2005-04-14**

Applied Michael Brady's qt backend patch: 1) fix a bug where keyboard input was grabbed by the figure and not released 2) turn on cursor changes 3) clean up a typo and commented-out print statement. - JDH

**2005-04-14**

Applied Eric Firing's masked data lines patch and contour patch. Support for masked arrays has been added to the plot command and to the Line2D object. Only the valid points are plotted. A "valid_only" kwarg was added to the get_xdata() and get_ydata() methods of Line2D; by default it is False, so that the original data arrays are returned. Setting it to True returns the plottable points. - see examples/masked_demo.py - JDH

**2005-04-13**

Applied Tim Leslie's arrow key event handling patch - JDH

### 0.80

**2005-04-11**

Applied a variant of rick's xlim/ylim/axis patch. These functions now take kwargs to let you selectively alter only the min or max if desired. e.g., xlim(xmin=2) or axis(ymax=3). They always return the new lim. - JDH

**2005-04-11**

Incorporated Werner's wx patch -- wx backend should be compatible with wxpython2.4 and recent versions of 2.5. Some early versions of wxpython 2.5 will not work because there was a temporary change in the dc API that was rolled back to make it 2.4 compliant

**2005-04-11**

modified tkagg show so that new figure window pops up on call to figure

**2005-04-11**

fixed wxapp init bug

**2005-04-02**

updated backend_ps.draw_lines, draw_markers for use with the new API - DSD

**2005-04-01**

Added editable polygon example

---

### 0.74 (2005-03-31)

**2005-03-30**

Fixed and added checks for floating point inaccuracy in ticker.Base - DSD

**2005-03-30**

updated /ellipse definition in backend_ps.py to address bug #1122041 - DSD

**2005-03-29**

Added unicode support for Agg and PS - JDH

**2005-03-28**

Added Jarrod's svg patch for text - JDH

**2005-03-28**

Added Ludal's arrow and quiver patch - JDH

**2005-03-28**

Added label kwarg to Axes to facilitate forcing the creation of new Axes with otherwise identical attributes

**2005-03-28**

Applied boxplot and OSX font search patches

**2005-03-27**

Added ft2font NULL check to fix Japanese font bug - JDH

**2005-03-27**

Added sprint legend patch plus John Gill's tests and fix -- see examples/legend_auto.py - JDH

---

### 0.73.1 (2005-03-19)

**2005-03-19**

Reverted wxapp handling because it crashed win32 - JDH

**2005-03-18**

Add .number attribute to figure objects returned by figure() - FP

---

### 0.73 (2005-03-18)

**2005-03-16**

Fixed labelsep bug

**2005-03-16**

Applied Darren's ticker fix for small ranges - JDH

**2005-03-16**

Fixed tick on horiz colorbar - JDH

**2005-03-16**

Added Japanese winreg patch - JDH

**2005-03-15**

backend_gtkagg.py: changed to use double buffering, this fixes the problem reported Joachim Berdal Haga - "Parts of plot lagging from previous frame in animation". Tested with anim.py and it makes no noticeable difference to performance (23.7 before, 23.6 after) - SC

**2005-03-14**

add src/_backend_gdk.c extension to provide a substitute function for pixbuf.get_pixels_array(). Currently pixbuf.get_pixels_array() only works with Numeric, and then only works if pygtk has been compiled with Numeric support. The change provides a function pixbuf_get_pixels_array() which works with Numeric and numarray and is always available. It means that backend_gtk should be able to display images and mathtext in all circumstances. - SC

**2005-03-11**

Upgraded CXX to 5.3.1

**2005-03-10**

remove GraphicsContextPS.set_linestyle() and GraphicsContextSVG.set_linestyle() since they do no more than the base class GraphicsContext.set_linestyle() - SC

**2005-03-09**

Refactored contour functionality into dedicated module

**2005-03-09**

Added Eric's contourf updates and Nadia's clabel functionality

**2005-03-09**

Moved colorbar to figure.Figure to expose it for API developers - JDH

**2005-03-09**

backend_cairo.py: implemented draw_markers() - SC

**2005-03-09**

cbook.py: only use enumerate() (the python version) if the builtin version is not available. Add new function 'izip' which is set to itertools.izip if available and the python equivalent if not available. - SC

**2005-03-07**

backend_gdk.py: remove PIXELS_PER_INCH from points_to_pixels(), but still use it to adjust font sizes. This allows the GTK version of line_styles.py to more closely match GTKAgg, previously the markers were being drawn too large. - SC

**2005-03-01**

Added Eric's contourf routines

**2005-03-01**

Added start of proper agg SWIG wrapper. I would like to expose agg functionality directly a the user level and this module will serve that purpose eventually, and will hopefully take over most of the functionality of the current _image and _backend_agg modules. - JDH

**2005-02-28**

Fixed polyfit / polyval to convert input args to float arrays - JDH

**2005-02-25**

Add experimental feature to backend_gtk.py to enable/disable double buffering (DBL_BUFFER=True/False) - SC

**2005-02-24**

colors.py change ColorConverter.to_rgb() so it always returns rgb (and not rgba), allow cnames keys to be cached, change the exception raised from RuntimeError to ValueError (like hex2color()) hex2color() use a regular expression to check the color string is valid - SC

**2005-02-23**

Added rc param ps.useafm so backend ps can use native afm fonts or truetype. afme breaks mathtext but causes much smaller font sizes and may result in images that display better in some contexts (e.g., pdfs incorporated into latex docs viewed in acrobat reader). I would like to extend this approach to allow the user to use truetype only for mathtext, which should be easy.

**2005-02-23**

Used sequence protocol rather than tuple in agg collection drawing routines for greater flexibility - JDH

---

### 0.72.1 (2005-02-22)

**2005-02-21**

fixed linestyles for collections -- contour now dashes for levels <0

**2005-02-21**

fixed ps color bug - JDH

**2005-02-15**

fixed missing qt file

**2005-02-15**

banished error_msg and report_error. Internal backend methods like error_msg_gtk are preserved. backend writers, check your backends, and diff against 0.72 to make sure I did the right thing! - JDH

**2005-02-14**

Added enthought traits to matplotlib tree - JDH

---

### 0.72 (2005-02-14)

**2005-02-14**

fix bug in cbook alltrue() and onetrue() - SC

**2005-02-11**

updated qtagg backend from Ted - JDH

**2005-02-11**

matshow fixes for figure numbering, return value and docs - FP

**2005-02-09**

new zorder example for fine control in zorder_demo.py - FP

**2005-02-09**

backend renderer draw_lines now has transform in backend, as in draw_markers; use numerix in _backend_agg, added small line optimization to agg

**2005-02-09**

subplot now deletes axes that it overlaps

**2005-02-08**

Added transparent support for gzipped files in load/save - Fernando Perez (FP from now on).

**2005-02-08**

Small optimizations in PS backend. They may have a big impact for large plots, otherwise they don't hurt - FP

**2005-02-08**

Added transparent support for gzipped files in load/save - Fernando Perez (FP from now on).

**2005-02-07**

Added newstyle path drawing for markers - only implemented in agg currently - JDH

**2005-02-05**

Some superscript text optimizations for ticking log plots

**2005-02-05**

Added some default key press events to pylab figures: 'g' toggles grid - JDH

**2005-02-05**

Added some support for handling log switching for lines that have nonpos data - JDH

**2005-02-04**

Added Nadia's contour patch - contour now has matlab compatible syntax; this also fixed an unequal sized contour array bug- JDH

**2005-02-04**

Modified GTK backends to allow the FigureCanvas to be resized smaller than its original size - SC

**2005-02-02**

Fixed a bug in dates mx2num - JDH

**2005-02-02**

Incorporated Fernando's matshow - JDH

**2005-02-01**

Added Fernando's figure num patch, including experimental support for pylab backend switching, LineCOllection.color warns, savefig now a figure method, fixed a close(fig) bug - JDH

**2005-01-31**

updated datalim in contour - JDH

**2005-01-30**

Added backend_qtagg.py provided by Sigve Tjora - SC

**2005-01-28**

Added tk.inspect rc param to .matplotlibrc. IDLE users should set tk.pythoninspect:True and interactive:True and backend:TkAgg

**2005-01-28**

Replaced examples/interactive.py with an updated script from Fernando Perez - SC

**2005-01-27**

Added support for shared x or y axes. See examples/shared_axis_demo.py and examples/ganged_plots.py

**2005-01-27**

Added Lee's patch for missing symbols leq and LEFTbracket to _mathtext_data - JDH

**2005-01-26**

Added Baptiste's two scales patch -- see help(twinx) in the pylab interface for more info. See also examples/two_scales.py

**2005-01-24**

Fixed a mathtext parser bug that prevented font changes in sub/superscripts - JDH

**2005-01-24**

Fixed contour to work w/ interactive changes in colormaps, clim, etc - JDH

---

### 0.71 (2005-01-21)

**2005-01-21**

Refactored numerix to solve vexing namespace issues - JDH

**2005-01-21**

Applied Nadia's contour bug fix - JDH

**2005-01-20**

Made some changes to the contour routine - particularly region=1 seems t fix a lot of the zigzag strangeness. Added colormaps as default for contour - JDH

**2005-01-19**

Restored builtin names which were overridden (min, max, abs, round, and sum) in pylab. This is a potentially significant change for those who were relying on an array version of those functions that previously overrode builtin function names. - ADS

**2005-01-18**

Added accents to mathtext: hat, breve, grave, bar, acute, tilde, vec, dot, ddot. All of them have the same syntax, e.g., to make an overbar you do bar{o} or to make an o umlaut you do ddot{o}. The shortcuts are also provided, e.g., "o 'e `e ~n .x ^y - JDH

**2005-01-18**

Plugged image resize memory leaks - JDH

**2005-01-18**

Fixed some mathtext parser problems relating to superscripts

**2005-01-17**

Fixed a yticklabel problem for colorbars under change of clim - JDH

**2005-01-17**

Cleaned up Destroy handling in wx reducing memleak/fig from approx 800k to approx 6k- JDH

**2005-01-17**

Added kappa to latex_to_bakoma - JDH

**2005-01-15**

Support arbitrary colorbar axes and horizontal colorbars - JDH

**2005-01-15**

Fixed colormap number of colors bug so that the colorbar has the same discretization as the image - JDH

**2005-01-15**

Added Nadia's x,y contour fix - JDH

**2005-01-15**

backend_cairo: added PDF support which requires pycairo 0.1.4. Its not usable yet, but is ready for when the Cairo PDF backend matures - SC

**2005-01-15**

Added Nadia's x,y contour fix

**2005-01-12**

Fixed set clip_on bug in artist - JDH

**2005-01-11**

Reverted pythoninspect in tkagg - JDH

**2005-01-09**

Fixed a backend_bases event bug caused when an event is triggered when location is None - JDH

**2005-01-07**

Add patch from Stephen Walton to fix bug in pylab.load() when the % character is included in a comment. - ADS

**2005-01-07**

Added markerscale attribute to Legend class. This allows the marker size in the legend to be adjusted relative to that in the plot. - ADS

**2005-01-06**

Add patch from Ben Vanhaeren to make the FigureManagerGTK vbox a public attribute - SC

---

**2004-12-30**

Release 0.70

**2004-12-28**

Added coord location to key press and added a examples/picker_demo.py

**2004-12-28**

Fixed coords notification in wx toolbar - JDH

**2004-12-28**

Moved connection and disconnection event handling to the FigureCanvasBase. Backends now only need to connect one time for each of the button press, button release and key press/release functions. The base class deals with callbacks and multiple connections. This fixes flakiness on some backends (tk, wx) in the presence of multiple connections and/or disconnect - JDH

**2004-12-27**

Fixed PS mathtext bug where color was not set - Jochen please verify correct - JDH

**2004-12-27**

Added Shadow class and added shadow kwarg to legend and pie for shadow effect - JDH

**2004-12-27**

Added pie charts and new example/pie_demo.py

**2004-12-23**

Fixed an agg text rotation alignment bug, fixed some text kwarg processing bugs, and added examples/text_rotation.py to explain and demonstrate how text rotations and alignment work in matplotlib. - JDH

---

### 0.65.1 (2004-12-22)

**2004-12-22**

Fixed colorbar bug which caused colorbar not to respond to changes in colormap in some instances - JDH

**2004-12-22**

Refactored NavigationToolbar in tkagg to support app embedding , init now takes (canvas, window) rather than (canvas, figman) - JDH

**2004-12-21**

Refactored axes and subplot management - removed add_subplot and add_axes from the FigureManager. classic toolbar updates are done via an observer pattern on the figure using add_axobserver. Figure now maintains the axes stack (for gca) and supports axes deletion. Ported changes to GTK, Tk, Wx, and FLTK. Please test! Added delaxes - JDH

**2004-12-21**

Lots of image optimizations - 4x performance boost over 0.65 JDH

**2004-12-20**

Fixed a figimage bug where the axes is shown and modified tkagg to move the destroy binding into the show method.

**2004-12-18**

Minor refactoring of NavigationToolbar2 to support embedding in an application - JDH

**2004-12-14**

Added linestyle to collections (currently broken) - JDH

**2004-12-14**

Applied Nadia's setupext patch to fix libstdc++ link problem with contour and solaris -JDH

**2004-12-14**

A number of pychecker inspired fixes, including removal of True and False from cbook which I erroneously thought was needed for python2.2 - JDH

**2004-12-14**

Finished porting doc strings for set introspection. Used silent_list for many get funcs that return lists. JDH

**2004-12-13**

dates.py: removed all timezone() calls, except for UTC - SC

### 0.65 (2004-12-13)

**2004-12-13**

colors.py: rgb2hex(), hex2color() made simpler (and faster), also rgb2hex() - added round() instead of integer truncation hex2color() - changed 256.0 divisor to 255.0, so now '#ffffff' becomes (1.0,1.0,1.0) not (0.996,0.996,0.996) - SC

**2004-12-11**

Added ion and ioff to pylab interface - JDH

**2004-12-11**

backend_template.py: delete FigureCanvasTemplate.realize() - most backends don't use it and its no longer needed

backend_ps.py, backend_svg.py: delete show() and draw_if_interactive() - they are not needed for image backends

backend_svg.py: write direct to file instead of StringIO

- SC

**2004-12-10**

Added zorder to artists to control drawing order of lines, patches and text in axes. See examples/zoder_demo.py - JDH

**2004-12-10**

Fixed colorbar bug with scatter - JDH

**2004-12-10**

Added Nadia Dencheva <dencheva@stsci.edu> contour code - JDH

**2004-12-10**

backend_cairo.py: got mathtext working - SC

**2004-12-09**

Added Norm Peterson's svg clipping patch

**2004-12-09**

Added Matthew Newville's wx printing patch

**2004-12-09**

Migrated matlab to pylab - JDH

**2004-12-09**

backend_gtk.py: split into two parts

- backend_gdk.py - an image backend
- backend_gtk.py - A GUI backend that uses GDK - SC

**2004-12-08**

backend_gtk.py: remove quit_after_print_xvfb(*args), show_xvfb(), Dialog_MeasureTool(gtk.Dialog) one month after sending mail to matplotlib-users asking if anyone still uses these functions - SC

**2004-12-02**

backend_bases.py, backend_template.py: updated some of the method documentation to make them consistent with each other - SC

**2004-12-04**

Fixed multiple bindings per event for TkAgg mpl_connect and mpl_disconnect. Added a "test_disconnect" command line parameter to coords_demo.py JTM

**2004-12-04**

Fixed some legend bugs JDH

**2004-11-30**

Added over command for oneoff over plots. e.g., over(plot, x, y, lw=2). Works with any plot function.

**2004-11-30**

Added bbox property to text - JDH

**2004-11-29**

Zoom to rect now respect reversed axes limits (for both linear and log axes). - GL

**2004-11-29**

Added the over command to the matlab interface. over allows you to add an overlay plot regardless of hold state. - JDH

**2004-11-25**

Added Printf to mplutils for printf style format string formatting in C++ (should help write better exceptions)

**2004-11-24**

IMAGE_FORMAT: remove from agg and gtkagg backends as its no longer used - SC

**2004-11-23**

Added matplotlib compatible set and get introspection. See set_and_get.py

**2004-11-23**

applied Norbert's patched and exposed legend configuration to kwargs - JDH

**2004-11-23**

backend_gtk.py: added a default exception handler - SC

**2004-11-18**

backend_gtk.py: change so that the backend knows about all image formats and does not need to use IMAGE_FORMAT in other backends - SC

**2004-11-18**

Fixed some report_error bugs in string interpolation as reported on SF bug tracker- JDH

**2004-11-17**

backend_gtkcairo.py: change so all print_figure() calls render using Cairo and get saved using backend_gtk.print_figure() - SC

**2004-11-13**

backend_cairo.py: Discovered the magic number (96) required for Cairo PS plots to come out the right size. Restored Cairo PS output and added support for landscape mode - SC

**2004-11-13**

Added ishold - JDH

**2004-11-12**

Added many new matlab colormaps - autumn bone cool copper flag gray hot hsv jet pink prism spring summer winter - PG

**2004-11-11**

greatly simplify the emitted postscript code - JV

**2004-11-12**

Added new plotting functions spy, spy2 for sparse matrix visualization - JDH

**2004-11-11**

Added rgrids, thetragrids for customizing the grid locations and labels for polar plots - JDH

**2004-11-11**

make the Gtk backends build without an X-server connection - JV

**2004-11-10**

matplotlib/__init__.py: Added FROZEN to signal we are running under py2exe (or similar) - is used by backend_gtk.py - SC

**2004-11-09**

backend_gtk.py: Made fix suggested by maffew@cat.org.au to prevent problems when py2exe calls pygtk.require(). - SC

**2004-11-09**

backend_cairo.py: Added support for printing to a fileobject. Disabled cairo PS output which is not working correctly. - SC

---

### 0.64 (2004-11-08)

**2004-11-04**

Changed -dbackend processing to only use known backends, so we don't clobber other non-matplotlib uses of -d, like -debug.

**2004-11-04**

backend_agg.py: added IMAGE_FORMAT to list the formats that the backend can save to. backend_gtkagg.py: added support for saving JPG files by using the GTK backend - SC

**2004-10-31**

backend_cairo.py: now produces png and ps files (although the figure sizing needs some work). pycairo did not wrap all the necessary functions, so I wrapped them myself, they are included in the backend_cairo.py doc string. - SC

**2004-10-31**

backend_ps.py: clean up the generated PostScript code, use the PostScript stack to hold intermediate values instead of storing them in the dictionary. - JV

**2004-10-30**

backend_ps.py, ft2font.cpp, ft2font.h: fix the position of text in the PostScript output. The new FT2Font method get_descent gives the distance between the lower edge of the bounding box and the baseline of a string. In backend_ps the text is shifted upwards by this amount. - JV

**2004-10-30**

backend_ps.py: clean up the code a lot. Change the PostScript output to be more DSC compliant. All definitions for the generated PostScript are now in a PostScript dictionary 'mpldict'. Moved the long comment about drawing ellipses from the PostScript output into a Python comment. - JV

**2004-10-30**

backend_gtk.py: removed FigureCanvasGTK.realize() as its no longer needed. Merged ColorManager into GraphicsContext backend_bases.py: For set_capstyle/joinstyle() only set cap or joinstyle if there is no error. - SC

**2004-10-30**

backend_gtk.py: tidied up print_figure() and removed some of the dependency on widget events - SC

**2004-10-28**

backend_cairo.py: The renderer is complete except for mathtext, draw_image() and clipping. gtkcairo works reasonably well. cairo does not yet create any files since I can't figure how to set the 'target surface', I don't think pycairo wraps the required functions - SC

**2004-10-28**

backend_gtk.py: Improved the save dialog (GTK 2.4 only) so it presents the user with a menu of supported image formats - SC

**2004-10-28**

backend_svg.py: change print_figure() to restore original face/edge color backend_ps.py : change print_figure() to ensure original face/edge colors are restored even if there's an IOError - SC

**2004-10-27**

Applied Norbert's errorbar patch to support barsabove kwarg

**2004-10-27**

Applied Norbert's legend patch to support None handles

**2004-10-27**

Added two more backends: backend_cairo.py, backend_gtkcairo.py They are not complete yet, currently backend_gtkcairo just renders polygons, rectangles and lines - SC

**2004-10-21**

Added polar axes and plots - JDH

**2004-10-20**

Fixed corrcoef bug exposed by corrcoef(X) where X is matrix - JDH

**2004-10-19**

Added kwarg support to xticks and yticks to set ticklabel text properties -- thanks to T. Edward Whalen for the suggestion

**2004-10-19**

Added support for PIL images in imshow(), image.py - ADS

**2004-10-19**

Re-worked exception handling in _image.py and _transforms.py to avoid masking problems with shared libraries. - JTM

**2004-10-16**

Streamlined the matlab interface wrapper, removed the noplot option to hist - just use mlab.hist instead.

**2004-09-30**

Added Andrew Dalke's strftime code to extend the range of dates supported by the DateFormatter - JDH

**2004-09-30**

Added barh - JDH

**2004-09-30**

Removed fallback to alternate array package from numerix so that ImportErrors are easier to debug. - JTM

**2004-09-30**

Add GTK+ 2.4 support for the message in the toolbar. SC

**2004-09-30**

Made some changes to support python22 - lots of doc fixes. - JDH

**2004-09-29**

Added a Verbose class for reporting - JDH

---

**2004-09-28**

Released 0.63.0

**2004-09-28**

Added save to file object for agg - see examples/print_stdout.py

**2004-09-24**

Reorganized all py code to lib subdir

**2004-09-24**

Fixed axes resize image edge effects on interpolation - required upgrade to agg22 which fixed an agg bug related to this problem

**2004-09-20**

Added toolbar2 message display for backend_tkagg. JTM

**2004-09-17**

Added coords formatter attributes. These must be callable, and return a string for the x or y data. These will be used to format the x and y data for the coords box. Default is the axis major formatter. e.g.:

```
# format the coords message box
def price(x): return '$%1.2f'%x
ax.format_xdata = DateFormatter('%Y-%m-%d')
ax.format_ydata = price
```

**2004-09-17**

Total rewrite of dates handling to use python datetime with num2date, date2num and drange. pytz for timezone handling, dateutils for spohisticated ticking. date ranges from 0001-9999 are supported. rrules allow arbitrary date ticking. examples/date_demo*.py converted to show new usage. new example examples/date_demo_rrule.py shows how to use rrules in date plots. The date locators are much more general and almost all of them have different constructors. See matplotlib.dates for more info.

**2004-09-15**

Applied Fernando's backend __init__ patch to support easier backend maintenance. Added his numutils to mlab. JDH

**2004-09-16**

Re-designated all files in matplotlib/images as binary and w/o keyword substitution using "cvs admin -kb *.svg ...". See binary files in "info cvs" under Linux. This was messing up builds from CVS on windows since CVS was doing lf -> cr/lf and keyword substitution on the bitmaps. - JTM

**2004-09-15**

Modified setup to build array-package-specific extensions for those extensions which are array-aware. Setup builds extensions automatically for either Numeric, numarray, or both, depending on what you have installed. Python proxy modules for the array-aware extensions import the version optimized for numarray or Numeric determined by numerix. - JTM

**2004-09-15**

Moved definitions of infinity from mlab to numerix to avoid divide by zero warnings for numarray - JTM

**2004-09-09**

Added axhline, axvline, axhspan and axvspan

---

### 0.62.4 (2004-08-30)

**2004-08-30**

Fixed a multiple images with different extent bug, Fixed markerfacecolor as RGB tuple

**2004-08-27**

Mathtext now more than 5x faster. Thanks to Paul Mcguire for fixes both to pyparsing and to the matplotlib grammar! mathtext broken on python2.2

**2004-08-25**

Exposed Darren's and Greg's log ticking and formatting options to semilogx and friends

**2004-08-23**

Fixed grid w/o args to toggle grid state - JDH

**2004-08-11**

Added Gregory's log patches for major and minor ticking

**2004-08-18**

Some pixel edge effects fixes for images

**2004-08-18**

Fixed TTF files reads in backend_ps on win32.

**2004-08-18**

Added base and subs properties for logscale plots, user modifiable using set_[x,y]scale('log',base=b,subs=[mt1,mt2,...]) - GL

**2004-08-18**

fixed a bug exposed by trying to find the HOME dir on win32 thanks to Alan Issac for pointing to the light - JDH

**2004-08-18**

fixed errorbar bug in setting ecolor - JDH

**2004-08-12**

Added Darren Dale's exponential ticking patch

**2004-08-11**

Added Gregory's fltkagg backend

---

### 0.61.0 (2004-08-09)

**2004-08-08**

backend_gtk.py: get rid of the final PyGTK deprecation warning by replacing gtkOptionMenu with gtkMenu in the 2.4 version of the classic toolbar.

**2004-08-06**

Added Tk zoom to rect rectangle, proper idle drawing, and keybinding - JDH

**2004-08-05**

Updated installing.html and INSTALL - JDH

**2004-08-01**

backend_gtk.py: move all drawing code into the expose_event()

**2004-07-28**

Added Greg's toolbar2 and backend_*agg patches - JDH

**2004-07-28**

Added image.imread with support for loading png into numerix arrays

**2004-07-28**

Added key modifiers to events - implemented dynamic updates and rubber banding for interactive pan/zoom - JDH

**2004-07-27**

did a readthrough of SVG, replacing all the string additions with string interps for efficiency, fixed some layout problems, added font and image support (through external pngs) - JDH

**2004-07-25**

backend_gtk.py: modify toolbar2 to make it easier to support GTK+ 2.4. Add GTK+ 2.4 toolbar support. - SC

**2004-07-24**

backend_gtk.py: Simplified classic toolbar creation - SC

**2004-07-24**

Added images/matplotlib.svg to be used when GTK+ windows are minimised - SC

**2004-07-22**

Added right mouse click zoom for NavigationToolbar2 panning mode. - JTM

**2004-07-22**

Added NavigationToolbar2 support to backend_tkagg. Minor tweak to backend_bases. - JTM

**2004-07-22**

Incorporated Gergory's renderer cache and buffer object cache - JDH

**2004-07-22**

Backend_gtk.py: Added support for GtkFileChooser, changed FileSelection/FileChooser so that only one instance pops up, and made them both modal. - SC

**2004-07-21**

Applied backend_agg memory leak patch from hayden - jocallo@online.no. Found and fixed a leak in binary operations on transforms. Moral of the story: never incref where you meant to decref! Fixed several leaks in ft2font: moral of story: almost always return Py::asObject over Py::Object - JDH

**2004-07-21**

Fixed a to string memory allocation bug in agg and image modules - JDH

**2004-07-21**

Added mpl_connect and mpl_disconnect to matlab interface - JDH

**2004-07-21**

Added beginnings of users_guide to CVS - JDH

**2004-07-20**

ported toolbar2 to wx

**2004-07-20**

upgraded to agg21 - JDH

**2004-07-20**

Added new icons for toolbar2 - JDH

**2004-07-19**

Added vertical mathtext for *Agg and GTK - thanks Jim Benson! - JDH

**2004-07-16**

Added ps/eps/svg savefig options to wx and gtk JDH

**2004-07-15**

Fixed python framework tk finder in setupext.py - JDH

**2004-07-14**

Fixed layer images demo which was broken by the 07/12 image extent fixes - JDH

**2004-07-13**

Modified line collections to handle arbitrary length segments for each line segment. - JDH

**2004-07-13**

Fixed problems with image extent and origin - set_image_extent deprecated. Use imshow(blah, blah, extent=(xmin, xmax, ymin, ymax) instead - JDH

**2004-07-12**

Added prototype for new nav bar with codified event handling. Use mpl_connect rather than connect for matplotlib event handling. toolbar style determined by rc toolbar param. backend status: gtk: prototype, wx: in progress, tk: not started - JDH

**2004-07-11**

backend_gtk.py: use builtin round() instead of redefining it. - SC

**2004-07-10**

Added embedding_in_wx3 example - ADS

**2004-07-09**

Added dynamic_image_wxagg to examples - ADS

**2004-07-09**

added support for embedding TrueType fonts in PS files - PEB

**2004-07-09**

fixed a sfnt bug exposed if font cache is not built

**2004-07-09**

added default arg None to matplotlib.matlab grid command to toggle current grid state

---

### 0.60.2 (2004-07-08)

**2004-07-08**

fixed a mathtext bug for '6'

**2004-07-08**

added some numarray bug workarounds

---

### 0.60 (2004-07-07)

**2004-07-07**

Fixed a bug in dynamic_demo_wx

**2004-07-07**

backend_gtk.py: raise SystemExit immediately if 'import pygtk' fails - SC

**2004-07-05**

Added new mathtext commands over{sym1}{sym2} and under{sym1}{sym2}

**2004-07-05**

Unified image and patch collections colormapping and scaling args. Updated docstrings for all - JDH

**2004-07-05**

Fixed a figure legend bug and added examples/figlegend_demo.py - JDH

**2004-07-01**

Fixed a memory leak in image and agg to string methods

**2004-06-25**

Fixed fonts_demo spacing problems and added a kwargs version of the fonts_demo fonts_demo_kw.py - JDH

**2004-06-25**

finance.py: handle case when urlopen() fails - SC

**2004-06-24**

Support for multiple images on axes and figure, with blending. Support for upper and lower image origins. clim, jet and gray functions in matlab interface operate on current image - JDH

**2004-06-23**

ported code to Perry's new colormap and norm scheme. Added new rc attributes image.aspect, image.interpolation, image.cmap, image.lut, image.origin

**2004-06-20**

backend_gtk.py: replace gtk.TRUE/FALSE with True/False. simplified _make_axis_menu(). - SC

**2004-06-19**

anim_tk.py: Updated to use TkAgg by default (not GTK) backend_gtk_py: Added '_' in front of private widget creation functions - SC

**2004-06-17**

backend_gtk.py: Create a GC once in realise(), not every time draw() is called. - SC

**2004-06-16**

Added new py2exe FAQ entry and added frozen support in get_data_path for py2exe - JDH

**2004-06-16**

Removed GTKGD, which was always just a proof-of-concept backend - JDH

**2004-06-16**

backend_gtk.py updates to replace deprecated functions gtk.mainquit(), gtk.mainloop(). Update NavigationToolbar to use the new GtkToolbar API - SC

**2004-06-15**

removed set_default_font from font_manager to unify font customization using the new function rc. See API_CHANGES for more info. The examples fonts_demo.py and fonts_demo_kw.py are ported to the new API - JDH

**2004-06-15**

Improved (yet again!) axis scaling to properly handle singleton plots - JDH

**2004-06-15**

Restored the old FigureCanvasGTK.draw() - SC

**2004-06-11**

More memory leak fixes in transforms and ft2font - JDH

**2004-06-11**

Eliminated numerix .numerix file and environment variable NUMERIX. Fixed bug which prevented command line overrides: --numarray or --numeric. - JTM

**2004-06-10**

Added rc configuration function rc; deferred all rc param setting until object creation time; added new rc attrs: lines.markerfacecolor, lines.markeredgecolor, lines.markeredgewidth, patch.linewidth, patch.facecolor, patch.edgecolor, patch.antialiased; see examples/customize_rc.py for usage - JDH

---

### 0.54.2 (2004-06-09)

**2004-06-08**

Rewrote ft2font using CXX as part of general memory leak fixes; also fixed transform memory leaks - JDH

**2004-06-07**

Fixed several problems with log ticks and scaling - JDH

**2004-06-07**

Fixed width/height issues for images - JDH

**2004-06-03**

Fixed draw_if_interactive bug for semilogx;

**2004-06-02**

Fixed text clipping to clip to axes - JDH

**2004-06-02**

Fixed leading newline text and multiple newline text - JDH

**2004-06-02**

Fixed plot_date to return lines - JDH

**2004-06-01**

Fixed plot to work with x or y having shape N,1 or 1,N - JDH

**2004-05-31**

Added renderer markeredgewidth attribute of Line2D. - ADS

**2004-05-29**

Fixed tick label clipping to work with navigation.

**2004-05-28**

**Added renderer grouping commands to support groups in**

SVG/PS. - JDH

**2004-05-28**

Fixed, this time I really mean it, the singleton plot plot([0]) scaling bug; Fixed Flavio's shape = N,1 bug - JDH

**2004-05-28**

added colorbar - JDH

**2004-05-28**

Made some changes to the matplotlib.colors.Colormap to properly support clim - JDH

---

### 0.54.1 (2004-05-27)

**2004-05-27**

Lots of small bug fixes: rotated text at negative angles, errorbar capsize and autoscaling, right tick label position, gtkagg on win98, alpha of figure background, singleton plots - JDH

**2004-05-26**

Added Gary's errorbar stuff and made some fixes for length one plots and constant data plots - JDH

**2004-05-25**

Tweaked TkAgg backend so that canvas.draw() works more like the other backends. Fixed a bug resulting in 2 draws per figure manager show(). - JTM

### 0.54 (2004-05-19)

**2004-05-18**

Added newline separated text with rotations to text.Text layout - JDH

**2004-05-16**

Added fast pcolor using PolyCollections. - JDH

**2004-05-14**

Added fast polygon collections - changed scatter to use them. Added multiple symbols to scatter. 10x speedup on large scatters using *Agg and 5X speedup for ps. - JDH

**2004-05-14**

On second thought... created an "nx" namespace in numerix which maps type names onto typecodes the same way for both numarray and Numeric. This undoes my previous change immediately below. To get a typename for Int16 usable in a Numeric extension: say nx.Int16. - JTM

**2004-05-15**

Rewrote transformation class in extension code, simplified all the artist constructors - JDH

**2004-05-14**

Modified the type definitions in the numarray side of numerix so that they are Numeric typecodes and can be used with Numeric compilex extensions. The original numarray types were renamed to type<old_name>. - JTM

**2004-05-06**

Gary Ruben sent me a bevy of new plot symbols and markers. See matplotlib.matlab.plot - JDH

**2004-05-06**

Total rewrite of mathtext - factored ft2font stuff out of layout engine and defined abstract class for font handling to lay groundwork for ps mathtext. Rewrote parser and made layout engine much more precise. Fixed all the layout hacks. Added spacing commands / and hspace. Added composite chars and defined angstrom. - JDH

**2004-05-05**

Refactored text instances out of backend; aligned text with arbitrary rotations is now supported - JDH

**2004-05-05**

Added a Matrix capability for numarray to numerix. JTM

**2004-05-04**

Updated whats_new.html.template to use dictionary and template loop, added anchors for all versions and items; updated goals.txt to use those for links. PG

**2004-05-04**

Added fonts_demo.py to backend_driver, and AFM and TTF font caches to font_manager.py - PEB

**2004-05-03**

Redid goals.html.template to use a goals.txt file that has a pseudo restructured text organization. PG

**2004-05-03**

Removed the close buttons on all GUIs and added the python #! bang line to the examples following Steve Chaplin's advice on matplotlib dev

**2004-04-29**

Added CXX and rewrote backend_agg using it; tracked down and fixed agg memory leak - JDH

**2004-04-29**

Added stem plot command - JDH

**2004-04-28**

Fixed PS scaling and centering bug - JDH

**2004-04-26**

Fixed errorbar autoscale problem - JDH

**2004-04-22**

Fixed copy tick attribute bug, fixed singular datalim ticker bug; fixed mathtext fontsize interactive bug. - JDH

**2004-04-21**

Added calls to draw_if_interactive to axes(), legend(), and pcolor(). Deleted duplicate pcolor(). - JTM

---

**2004-04-21**

matplotlib 0.53 release

**2004-04-19**

Fixed vertical alignment bug in PS backend - JDH

**2004-04-17**

Added support for two scales on the "same axes" with tick different ticking and labeling left right or top bottom. See examples/two_scales.py - JDH

**2004-04-17**

Added default dirs as list rather than single dir in setupext.py - JDH

**2004-04-16**

Fixed wx exception swallowing bug (and there was much rejoicing!) - JDH

**2004-04-16**

Added new ticker locator a formatter, fixed default font return - JDH

**2004-04-16**

Added get_name method to FontProperties class. Fixed font lookup in GTK and WX backends. - PEB

**2004-04-16**

Added get- and set_fontstyle methods. - PEB

**2004-04-10**

Mathtext fixes: scaling with dpi, - JDH

**2004-04-09**

Improved font detection algorithm. - PEB

**2004-04-09**

Move deprecation warnings from text.py to __init__.py - PEB

**2004-04-09**

Added default font customization - JDH

**2004-04-08**

Fixed viewlim set problem on axes and axis. - JDH

**2004-04-07**

Added validate_comma_sep_str and font properties parameters to __init__. Removed font families and added rcParams to FontProperties __init__ arguments in font_manager. Added default font property parameters to .matplotlibrc file with descriptions. Added deprecation warnings to the get_ - and set_fontXXX methods of the Text object. - PEB

**2004-04-06**

Added load and save commands for ASCII data - JDH

**2004-04-05**

Improved font caching by not reading AFM fonts until needed. Added better documentation. Changed the behaviour of the get_family, set_family, and set_name methods of FontProperties. - PEB

**2004-04-05**

Added WXAgg backend - JDH

**2004-04-04**

Improved font caching in backend_agg with changes to font_manager - JDH

**2004-03-29**

Fixed fontdicts and kwargs to work with new font manager - JDH

This is the Old, stale, never used changelog

**2002-12-10**

- Added a TODO file and CHANGELOG. Lots to do -- get crackin'!
- Fixed y zoom tool bug
- Adopted a compromise fix for the y data clipping problem. The problem was that for solid lines, the y data clipping (as opposed to the gc clipping) caused artifactual horizontal solid lines near the ylim boundaries. I did a 5% offset hack in Axes set_ylim functions which helped, but didn't cure the problem for very high gain y zooms. So I disabled y data clipping for connected lines . If you need extensive y clipping, either plot(y,x) because x data clipping is always enabled, or change the _set_clip code to 'if 1' as indicated in the lines.py src. See _set_clip in lines.py and set_ylim in figure.py for more information.

**2002-12-11**

- Added a measurement dialog to the figure window to measure axes position and the delta x delta y with a left mouse drag. These defaults can be overridden by deriving from Figure and overriding button_press_event, button_release_event, and motion_notify_event, and _dialog_measure_tool.
- fixed the navigation dialog so you can check the axes the navigation buttons apply to.

**2003-04-23**

Released matplotlib v0.1

**2003-04-24**

Added a new line style PixelLine2D which is the plots the markers as pixels (as small as possible) with format symbol ','

Added a new class Patch with derived classes Rectangle, RegularPolygon and Circle

**2003-04-25**

Implemented new functions errorbar, scatter and hist

Added a new line type '|' which is a vline. syntax is plot(x, Y, '|') where y.shape = len(x),2 and each row gives the ymin,ymax for the respective values of x. Previously I had implemented vlines as a list of lines, but I needed the efficiency of the numeric clipping for large numbers of vlines outside the viewport, so I wrote a dedicated class Vline2D which derives from Line2D

**2003-05-01**

Fixed ytick bug where grid and tick show outside axis viewport with gc clip

**2003-05-14**

Added new ways to specify colors 1) matlab format string 2) html-style hex string, 3) rgb tuple. See examples/color_demo.py

**2003-05-28**

Changed figure rendering to draw form a pixmap to reduce flicker. See examples/system_monitor.py for an example where the plot is continuously updated w/o flicker. This example is meant to simulate a system monitor that shows free CPU, RAM, etc...

**2003-08-04**

Added Jon Anderson's GTK shell, which doesn't require pygtk to have threading built-in and looks nice!

**2003-08-25**

Fixed deprecation warnings for python2.3 and pygtk-1.99.18

**2003-08-26**

Added figure text with new example examples/figtext.py

**2003-08-27**

Fixed bugs in figure text with font override dictionaries and fig text that was placed outside the window bounding box

**2003-09-01 through 2003-09-15**

Added a postscript and a GD module backend

**2003-09-16**

Fixed font scaling and point scaling so circles, squares, etc on lines will scale with DPI as will fonts. Font scaling is not fully implemented on the gtk backend because I have not figured out how to scale fonts to arbitrary sizes with GTK

**2003-09-17**

Fixed figure text bug which crashed X windows on long figure text extending beyond display area. This was, I believe, due to the vestigial erase functionality that was no longer needed since I began rendering to a pixmap

**2003-09-30**

Added legend

**2003-10-01**

Fixed bug when colors are specified with rgb tuple or hex string.

**2003-10-21**

Andrew Straw provided some legend code which I modified and incorporated. Thanks Andrew!

**2003-10-27**

Fixed a bug in axis.get_view_distance that affected zoom in versus out with interactive scrolling, and a bug in the axis text reset system that prevented the text from being redrawn on a interactive gtk view lim set with the widget

Fixed a bug in that prevented the manual setting of ticklabel strings from working properly

**2003-11-02**

- Do a nearest neighbor color pick on GD when allocate fails

**2003-11-02**

- Added pcolor plot
- Added MRI example
- Fixed bug that screwed up label position if xticks or yticks were empty
- added nearest neighbor color picker when GD max colors exceeded
- fixed figure background color bug in GD backend

**2003-11-10 - 2003-11-11**

major refactoring.

- Ticks (with labels, lines and grid) handled by dedicated class
- Artist now know bounding box and dpi
- Bounding boxes and transforms handled by dedicated classes
- legend in dedicated class. Does a better job of alignment and bordering. Can be initialized with specific line instances. See examples/legend_demo2.py

**2003-11-14**

Fixed legend positioning bug and added new position args

**2003-11-16**

Finished porting GD to new axes API

**2003-11-20**

- add TM for matlab on website and in docs

**2003-11-20**

- make a nice errorbar and scatter screenshot

**2003-11-20**

- auto line style cycling for multiple line types broken

**2003-11-18**

(using inkrect) :logical rect too big on gtk backend

**2003-11-18**

ticks don't reach edge of axes in gtk mode -- rounding error?

**2003-11-20**

- port Gary's errorbar code to new API before 0.40

**2003-11-20**

- problem with stale _set_font. legend axes box doesn't resize on save in GTK backend -- see htdocs legend_demo.py

**2003-11-21**

- make a dash-dot dict for the GC

**2003-12-15**

- fix install path bug

### 9.20.2 What's new in Matplotlib 0.99 (Aug 29, 2009)

**Table of Contents**

- *What's new in Matplotlib 0.99 (Aug 29, 2009)*
  - *New documentation*
  - *mplot3d*
  - *axes grid toolkit*
  - *Axis spine placement*

#### New documentation

Jae-Joon Lee has written two new guides *Legend guide* and *Advanced annotation*. Michael Sarahan has written *Image tutorial*. John Hunter has written two new tutorials on working with paths and transformations: *Path Tutorial* and *Transformations Tutorial*.

#### mplot3d

Reinier Heeres has ported John Porter's mplot3d over to the new matplotlib transformations framework, and it is now available as a toolkit mpl_toolkits.mplot3d (which now comes standard with all mpl installs). See *3D plotting* and *The mplot3d toolkit*.

#### axes grid toolkit

Jae-Joon Lee has added a new toolkit to ease displaying multiple images in matplotlib, as well as some support for curvilinear grids to support the world coordinate system. The toolkit is included standard with all new mpl installs. See *Module - axes_grid1*, *Module - axisartist*, *The axes_grid1 toolkit* and *axisartist*

#### Axis spine placement

Andrew Straw has added the ability to place "axis spines" -- the lines that denote the data limits -- in various arbitrary locations. No longer are your axis lines constrained to be a simple rectangle around the figure -- you can turn on or off left, bottom, right and top, as well as "detach" the spine to offset it away from the data. See *Spine placement* and `matplotlib.spines.Spine`.

### 9.20.3 Changes beyond 0.99.x

- The default behavior of `matplotlib.axes.Axes.set_xlim()`, `matplotlib.axes.Axes.set_ylim()`, and `matplotlib.axes.Axes.axis()`, and their corresponding pyplot functions, has been changed: when view limits are set explicitly with one of these methods, autoscaling is turned off for the matching axis. A new *auto* kwarg is available to control this behavior. The limit kwargs have been renamed to *left* and *right* instead of *xmin* and *xmax*, and *bottom* and *top* instead of *ymin* and *ymax*. The old names may still be used, however.
- There are five new Axes methods with corresponding pyplot functions to facilitate autoscaling, tick location, and tick label formatting, and the general appearance of ticks and tick labels:
  - `matplotlib.axes.Axes.autoscale()` turns autoscaling on or off, and applies it.
  - `matplotlib.axes.Axes.margins()` sets margins used to autoscale the `matplotlib.axes.Axes.viewLim` based on the `matplotlib.axes.Axes.dataLim`.
  - `matplotlib.axes.Axes.locator_params()` allows one to adjust axes locator parameters such as *nbins*.
  - `matplotlib.axes.Axes.ticklabel_format()` is a convenience method for controlling the `matplotlib.ticker.ScalarFormatter` that is used by default with linear axes.
  - `matplotlib.axes.Axes.tick_params()` controls direction, size, visibility, and color of ticks and their labels.
- The `matplotlib.axes.Axes.bar()` method accepts a *error_kw* kwarg; it is a dictionary of kwargs to be passed to the errorbar function.
- The `matplotlib.axes.Axes.hist()` *color* kwarg now accepts a sequence of color specs to match a sequence of datasets.
- The `EllipseCollection` has been changed in two ways:
  - There is a new *units* option, 'xy', that scales the ellipse with the data units. This matches the :class:'~matplotlib.patches.Ellipse` scaling.
  - The *height* and *width* kwargs have been changed to specify the height and width, again for consistency with `Ellipse`, and to better match their names; previously they specified the half-height and half-width.
- There is a new rc parameter `axes.color_cycle`, and the color cycle is now independent of the rc parameter `lines.color`. `matplotlib.Axes.set_default_color_cycle` is deprecated.

- You can now print several figures to one pdf file and modify the document information dictionary of a pdf file. See the docstrings of the class *matplotlib.backends.backend_pdf.PdfPages* for more information.
- Removed configobj and enthought.traits packages, which are only required by the experimental traited config and are somewhat out of date. If needed, install them independently.
- The new rc parameter `savefig.extension` sets the filename extension that is used by *matplotlib.figure.Figure.savefig()* if its *fname* argument lacks an extension.
- In an effort to simplify the backend API, all clipping rectangles and paths are now passed in using GraphicsContext objects, even on collections and images. Therefore:

```
draw_path_collection(self, master_transform, cliprect, clippath,
                     clippath_trans, paths, all_transforms, offsets,
                     offsetTrans, facecolors, edgecolors, linewidths,
                     linestyles, antialiaseds, urls)

# is now

draw_path_collection(self, gc, master_transform, paths, all_transforms,
                     offsets, offsetTrans, facecolors, edgecolors,
                     linewidths, linestyles, antialiaseds, urls)

draw_quad_mesh(self, master_transform, cliprect, clippath,
               clippath_trans, meshWidth, meshHeight, coordinates,
               offsets, offsetTrans, facecolors, antialiased,
               showedges)

# is now

draw_quad_mesh(self, gc, master_transform, meshWidth, meshHeight,
               coordinates, offsets, offsetTrans, facecolors,
               antialiased, showedges)

draw_image(self, x, y, im, bbox, clippath=None, clippath_trans=None)

# is now

draw_image(self, gc, x, y, im)
```

- There are four new Axes methods with corresponding pyplot functions that deal with unstructured triangular grids:
  - *matplotlib.axes.Axes.tricontour()* draws contour lines on a triangular grid.
  - *matplotlib.axes.Axes.tricontourf()* draws filled contours on a triangular grid.
  - *matplotlib.axes.Axes.tripcolor()* draws a pseudocolor plot on a triangular grid.
  - *matplotlib.axes.Axes.triplot()* draws a triangular grid as lines and/or markers.

### 9.20.4 Changes in 0.99

- pylab no longer provides a load and save function. These are available in matplotlib.mlab, or you can use numpy.loadtxt and numpy.savetxt for text files, or np.save and np.load for binary NumPy arrays.
- User-generated colormaps can now be added to the set recognized by `matplotlib.cm.get_cmap`. Colormaps can be made the default and applied to the current image using *`matplotlib.pyplot.set_cmap()`*.
- changed use_mrecords default to False in mlab.csv2rec since this is partially broken
- Axes instances no longer have a "frame" attribute. Instead, use the new "spines" attribute. Spines is a dictionary where the keys are the names of the spines (e.g., 'left','right' and so on) and the values are the artists that draw the spines. For normal (rectilinear) axes, these artists are Line2D instances. For other axes (such as polar axes), these artists may be Patch instances.
- Polar plots no longer accept a resolution kwarg. Instead, each Path must specify its own number of interpolation steps. This is unlikely to be a user-visible change -- if interpolation of data is required, that should be done before passing it to Matplotlib.

### 9.20.5 What's new in Matplotlib 0.98.4

**Table of Contents**

- *What's new in Matplotlib 0.98.4*
  - *Legend enhancements*
  - *Fancy annotations and arrows*
  - *Native OS X backend*
  - *psd amplitude scaling*
  - *Fill between*
  - *Lots more*

It's been four months since the last matplotlib release, and there are a lot of new features and bug-fixes.

Thanks to Charlie Moad for testing and preparing the source release, including binaries for OS X and Windows for python 2.4 and 2.5 (2.6 and 3.0 will not be available until numpy is available on those releases). Thanks to the many developers who contributed to this release, with contributions from Jae-Joon Lee, Michael Droettboom, Ryan May, Eric Firing, Manuel Metz, Jouni K. Seppänen, Jeff Whitaker, Darren Dale, David Kaplan, Michiel de Hoon and many others who submitted patches

### Legend enhancements

Jae-Joon has rewritten the legend class, and added support for multiple columns and rows, as well as fancy box drawing. See *legend()* and *matplotlib.legend.Legend*.

### Fancy annotations and arrows

Jae-Joon has added lots of support to annotations for drawing fancy boxes and connectors in annotations. See *annotate()* and *BoxStyle*, *ArrowStyle*, and *ConnectionStyle*.

### Native OS X backend

Michiel de Hoon has provided a native Mac OSX backend that is almost completely implemented in C. The backend can therefore use Quartz directly and, depending on the application, can be orders of magnitude faster than the existing backends. In addition, no third-party libraries are needed other than Python and NumPy. The backend is interactive from the usual terminal application on Mac using regular Python. It hasn't been tested with ipython yet, but in principle it should to work there as well. Set 'backend : macosx' in your matplotlibrc file, or run your script with:

```
> python myfile.py -dmacosx
```

### psd amplitude scaling

Ryan May did a lot of work to rationalize the amplitude scaling of *psd()* and friends. See *Power spectral density (PSD)*. The changes should increase MATLAB compatibility and increase scaling options.

### Fill between

Added a *fill_between()* function to make it easier to do shaded region plots in the presence of masked data. You can pass an *x* array and a *ylower* and *yupper* array to fill between, and an optional *where* argument which is a logical mask where you want to do the filling.

### Lots more

Here are the 0.98.4 notes from the CHANGELOG:

```
Added mdehoon's native macosx backend from sf patch 2179017 - JDH

Removed the prints in the set_*style commands.  Return the list of
pretty-printed strings instead - JDH
```

(continues on next page)

(continued from previous page)

```
Some of the changes Michael made to improve the output of the
property tables in the rest docs broke of made difficult to use
some of the interactive doc helpers, e.g., setp and getp.  Having all
the rest markup in the ipython shell also confused the docstrings.
I added a new rc param docstring.harcopy, to format the docstrings
differently for hardcopy and other use.  The ArtistInspector
could use a little refactoring now since there is duplication of
effort between the rest out put and the non-rest output - JDH

Updated spectral methods (psd, csd, etc.) to scale one-sided
densities by a factor of 2 and, optionally, scale all densities by
the sampling frequency.  This gives better MATLAB
compatibility. -RM

Fixed alignment of ticks in colorbars. -MGD

drop the deprecated "new" keyword of np.histogram() for numpy 1.2
or later.  -JJL

Fixed a bug in svg backend that new_figure_manager() ignores
keywords arguments such as figsize, etc. -JJL

Fixed a bug that the handlelength of the new legend class set too
short when numpoints=1 -JJL

Added support for data with units (e.g., dates) to
Axes.fill_between. -RM

Added fancybox keyword to legend. Also applied some changes for
better look, including baseline adjustment of the multiline texts
so that it is center aligned. -JJL

The transmuter classes in the patches.py are reorganized as
subclasses of the Style classes. A few more box and arrow styles
are added. -JJL

Fixed a bug in the new legend class that didn't allowed a tuple of
coordinate values as loc. -JJL

Improve checks for external dependencies, using subprocess
(instead of deprecated popen*) and distutils (for version
checking) - DSD

Reimplementation of the legend which supports baseline alignment,
multi-column, and expand mode. - JJL

Fixed histogram autoscaling bug when bins or range are given
explicitly (fixes Debian bug 503148) - MM

Added rcParam axes.unicode_minus which allows plain hyphen for
minus when False - JDH
```

(continues on next page)

(continued from previous page)

```
Added scatterpoints support in Legend. patch by Erik Tollerud -
JJL

Fix crash in log ticking. - MGD

Added static helper method BrokenHBarCollection.span_where and
Axes/pyplot method fill_between.  See
examples/pylab/fill_between.py - JDH

Add x_isdata and y_isdata attributes to Artist instances, and use
them to determine whether either or both coordinates are used when
updating dataLim.  This is used to fix autoscaling problems that
had been triggered by axhline, axhspan, axvline, axvspan. - EF

Update the psd(), csd(), cohere(), and specgram() methods of Axes
and the csd() cohere(), and specgram() functions in mlab to be in
sync with the changes to psd().  In fact, under the hood, these
all call the same core to do computations. - RM

Add 'pad_to' and 'sides' parameters to mlab.psd() to allow
controlling of zero padding and returning of negative frequency
components, respectively.  These are added in a way that does not
change the API. - RM

Fix handling of c kwarg by scatter; generalize is_string_like to
accept numpy and numpy.ma string array scalars. - RM and EF

Fix a possible EINTR problem in dviread, which might help when
saving pdf files from the qt backend. - JKS

Fix bug with zoom to rectangle and twin axes - MGD

Added Jae Joon's fancy arrow, box and annotation enhancements --
see examples/pylab_examples/annotation_demo2.py

Autoscaling is now supported with shared axes - EF

Fixed exception in dviread that happened with Minion - JKS

set_xlim, ylim now return a copy of the viewlim array to avoid
modify inplace surprises

Added image thumbnail generating function
matplotlib.image.thumbnail.  See examples/misc/image_thumbnail.py
- JDH

Applied scatleg patch based on ideas and work by Erik Tollerud and
Jae-Joon Lee. - MM

Fixed bug in pdf backend: if you pass a file object for output
instead of a filename, e.g., in a wep app, we now flush the object
```

(continues on next page)

(continued from previous page)

```
at the end. - JKS

Add path simplification support to paths with gaps. - EF

Fix problem with AFM files that don't specify the font's full name
or family name. - JKS

Added 'scilimits' kwarg to Axes.ticklabel_format() method, for
easy access to the set_powerlimits method of the major
ScalarFormatter. - EF

Experimental new kwarg borderpad to replace pad in legend, based
on suggestion by Jae-Joon Lee.  - EF

Allow spy to ignore zero values in sparse arrays, based on patch
by Tony Yu.  Also fixed plot to handle empty data arrays, and
fixed handling of markers in figlegend. - EF

Introduce drawstyles for lines. Transparently split linestyles
like 'steps--' into drawstyle 'steps' and linestyle '--'.  Legends
always use drawstyle 'default'. - MM

Fixed quiver and quiverkey bugs (failure to scale properly when
resizing) and added additional methods for determining the arrow
angles - EF

Fix polar interpolation to handle negative values of theta - MGD

Reorganized cbook and mlab methods related to numerical
calculations that have little to do with the goals of those two
modules into a separate module numerical_methods.py Also, added
ability to select points and stop point selection with keyboard in
ginput and manual contour labeling code.  Finally, fixed contour
labeling bug. - DMK

Fix backtick in Postscript output. - MGD

[ 2089958 ] Path simplification for vector output backends
Leverage the simplification code exposed through path_to_polygons
to simplify certain well-behaved paths in the vector backends
(PDF, PS and SVG).  "path.simplify" must be set to True in
matplotlibrc for this to work.  - MGD

Add "filled" kwarg to Path.intersects_path and
Path.intersects_bbox. - MGD

Changed full arrows slightly to avoid an xpdf rendering problem
reported by Friedrich Hagedorn. - JKS

Fix conversion of quadratic to cubic Bezier curves in PDF and PS
backends. Patch by Jae-Joon Lee. - JKS
```

(continues on next page)

(continued from previous page)

```
Added 5-point star marker to plot command q- EF

Fix hatching in PS backend - MGD

Fix log with base 2 - MGD

Added support for bilinear interpolation in
NonUniformImage; patch by Gregory Lielens. - EF

Added support for multiple histograms with data of
different length - MM

Fix step plots with log scale - MGD

Fix masked arrays with markers in non-Agg backends - MGD

Fix clip_on kwarg so it actually works correctly - MGD

Fix locale problems in SVG backend - MGD

fix quiver so masked values are not plotted - JSW

improve interactive pan/zoom in qt4 backend on windows - DSD

Fix more bugs in NaN/inf handling.  In particular, path
simplification (which does not handle NaNs or infs) will be turned
off automatically when infs or NaNs are present.  Also masked
arrays are now converted to arrays with NaNs for consistent
handling of masks and NaNs - MGD and EF

Added support for arbitrary rasterization resolutions to the SVG
backend. - MW
```

### 9.20.6 Changes for 0.98.x

- `psd()`, `csd()`, and `cohere()` will now automatically wrap negative frequency components to the beginning of the returned arrays. This is much more sensible behavior and makes them consistent with `specgram()`. The previous behavior was more of an oversight than a design decision.
- Added new keyword parameters *nonposx*, *nonposy* to *matplotlib.axes.Axes* methods that set log scale parameters. The default is still to mask out non-positive values, but the kwargs accept 'clip', which causes non-positive values to be replaced with a very small positive value.
- Added new *matplotlib.pyplot.fignum_exists()* and *matplotlib.pyplot.get_fignums()*; they merely expose information that had been hidden in `matplotlib._pylab_helpers`.
- Deprecated numerix package.
- Added new *matplotlib.image.imsave()* and exposed it to the *matplotlib.pyplot* interface.

- Remove support for pyExcelerator in exceltools -- use xlwt instead
- Changed the defaults of acorr and xcorr to use usevlines=True, maxlags=10 and normed=True since these are the best defaults
- Following keyword parameters for *matplotlib.legend.Legend* are now deprecated and new set of parameters are introduced. The new parameters are given as a fraction of the font-size. Also, *scatteryoffsets*, *fancybox* and *columnspacing* are added as keyword parameters.

| Deprecated | New |
|---|---|
| pad | borderpad |
| labelsep | labelspacing |
| handlelen | handlelength |
| handlestextsep | handletextpad |
| axespad | borderaxespad |

- Removed the configobj and experimental traits rc support
- Modified *matplotlib.mlab.psd()*, *matplotlib.mlab.csd()*, *matplotlib.mlab.cohere()*, and *matplotlib.mlab.specgram()* to scale one-sided densities by a factor of 2. Also, optionally scale the densities by the sampling frequency, which gives true values of densities that can be integrated by the returned frequency values. This also gives better MATLAB compatibility. The corresponding *matplotlib.axes.Axes* methods and *matplotlib.pyplot* functions were updated as well.
- Font lookup now uses a nearest-neighbor approach rather than an exact match. Some fonts may be different in plots, but should be closer to what was requested.
- *matplotlib.axes.Axes.set_xlim()*, *matplotlib.axes.Axes.set_ylim()* now return a copy of the `viewlim` array to avoid modify-in-place surprises.
- `matplotlib.afm.AFM.get_fullname` and `matplotlib.afm.AFM.get_familyname` no longer raise an exception if the AFM file does not specify these optional attributes, but returns a guess based on the required FontName attribute.
- Changed precision kwarg in *matplotlib.pyplot.spy()*; default is 0, and the string value 'present' is used for sparse arrays only to show filled locations.
- *matplotlib.collections.EllipseCollection* added.
- Added `angles` kwarg to *matplotlib.pyplot.quiver()* for more flexible specification of the arrow angles.
- Deprecated (raise NotImplementedError) all the mlab2 functions from *matplotlib.mlab* out of concern that some of them were not clean room implementations.
- Methods *matplotlib.collections.Collection.get_offsets()* and *matplotlib.collections.Collection.set_offsets()* added to *Collection* base class.
- `matplotlib.figure.Figure.figurePatch` renamed `matplotlib.figure.Figure.patch`; `matplotlib.axes.Axes.axesPatch` renamed `matplotlib.axes.Axes.patch`; `matplotlib.axes.Axes.axesFrame` renamed `matplotlib.axes.Axes.`

frame. matplotlib.axes.Axes.get_frame, which returns matplotlib.axes.Axes.patch, is deprecated.

- Changes in the *matplotlib.contour.ContourLabeler* attributes (*matplotlib.pyplot.clabel()* function) so that they all have a form like .labelAttribute. The three attributes that are most likely to be used by end users, .cl, .cl_xy and .cl_cvalues have been maintained for the moment (in addition to their renamed versions), but they are deprecated and will eventually be removed.
- Moved several functions in *matplotlib.mlab* and *matplotlib.cbook* into a separate module matplotlib.numerical_methods because they were unrelated to the initial purpose of mlab or cbook and appeared more coherent elsewhere.

### 9.20.7 Changes for 0.98.1

- Removed broken matplotlib.axes3d support and replaced it with a non-implemented error pointing to 0.91.x

### 9.20.8 Changes for 0.98.0

- *matplotlib.image.imread()* now no longer always returns RGBA data---if the image is luminance or RGB, it will return a MxN or MxNx3 array if possible. Also uint8 is no longer always forced to float.
- Rewrote the *matplotlib.cm.ScalarMappable* callback infrastructure to use *matplotlib.cbook.CallbackRegistry* rather than custom callback handling. Any users of matplotlib.cm.ScalarMappable.add_observer of the *ScalarMappable* should use the matplotlib.cm.ScalarMappable.callbacksSM *CallbackRegistry* instead.
- New axes function and Axes method provide control over the plot color cycle: matplotlib.axes.set_default_color_cycle and matplotlib.axes.Axes.set_color_cycle.
- Matplotlib now requires Python 2.4, so *matplotlib.cbook* will no longer provide set, enumerate(), reversed() or izip compatibility functions.
- In Numpy 1.0, bins are specified by the left edges only. The axes method *matplotlib.axes.Axes.hist()* now uses future Numpy 1.3 semantics for histograms. Providing binedges, the last value gives the upper-right edge now, which was implicitly set to +infinity in Numpy 1.0. This also means that the last bin doesn't contain upper outliers any more by default.
- New axes method and pyplot function, *hexbin()*, is an alternative to *scatter()* for large datasets. It makes something like a *pcolor()* of a 2-D histogram, but uses hexagonal bins.
- New kwarg, symmetric, in *matplotlib.ticker.MaxNLocator* allows one require an axis to be centered around zero.
- Toolkits must now be imported from mpl_toolkits (not matplotlib.toolkits)

### Notes about the transforms refactoring

A major new feature of the 0.98 series is a more flexible and extensible transformation infrastructure, written in Python/Numpy rather than a custom C extension.

The primary goal of this refactoring was to make it easier to extend matplotlib to support new kinds of projections. This is mostly an internal improvement, and the possible user-visible changes it allows are yet to come.

See *matplotlib.transforms* for a description of the design of the new transformation framework.

For efficiency, many of these functions return views into Numpy arrays. This means that if you hold on to a reference to them, their contents may change. If you want to store a snapshot of their current values, use the Numpy array method copy().

The view intervals are now stored only in one place -- in the *matplotlib.axes.Axes* instance, not in the locator instances as well. This means locators must get their limits from their *matplotlib.axis.Axis*, which in turn looks up its limits from the *Axes*. If a locator is used temporarily and not assigned to an Axis or Axes, (e.g., in *matplotlib.contour*), a dummy axis must be created to store its bounds. Call *matplotlib.ticker.TickHelper.create_dummy_axis()* to do so.

The functionality of `Pbox` has been merged with *Bbox*. Its methods now all return copies rather than modifying in place.

The following lists many of the simple changes necessary to update code from the old transformation framework to the new one. In particular, methods that return a copy are named with a verb in the past tense, whereas methods that alter an object in place are named with a verb in the present tense.

### matplotlib.transforms

| Old method | New method |
|---|---|
| `Bbox.get_bounds` | *transforms.Bbox.bounds* |
| `Bbox.width` | *transforms.Bbox.width* |
| `Bbox.height` | *transforms.Bbox.height* |
| `Bbox.intervalx().get_bounds()` `Bbox.intervalx().set_bounds()` | *transforms.Bbox.intervalx* [It is now a property.] |
| `Bbox.intervaly().get_bounds()` `Bbox.intervaly().set_bounds()` | *transforms.Bbox.intervaly* [It is now a property.] |
| `Bbox.xmin` | *transforms.Bbox.x0* or *transforms.Bbox.xmin*[1] |
| `Bbox.ymin` | *transforms.Bbox.y0* or *transforms.Bbox.ymin*[Page 4611, 1] |
| `Bbox.xmax` | *transforms.Bbox.x1* or *transforms.Bbox.xmax*[1] |
| `Bbox.ymax` | *transforms.Bbox.y1* or *transforms.Bbox.ymax*[1] |
| `Bbox.overlaps(bboxes)` | *Bbox.count_overlaps(bboxes)* |
| `bbox_all(bboxes)` | *Bbox.union(bboxes)* [It is a staticmethod.] |
| `lbwh_to_bbox(l, b, w, h)` | *Bbox.from_bounds(x0, y0, w, h)* [It is a staticmethod.] |
| `inverse_transform_bbox(trans, bbox)` | `bbox.inverse_transformed(trans)` |
| `Interval.contains_open(v)` | *interval_contains_open(tuple, v)* |
| `Interval.contains(v)` | *interval_contains(tuple, v)* |
| `identity_transform()` | *transforms.IdentityTransform* |
| `blend_xy_sep_transform(xtrans, ytrans)` | *blended_transform_factory(xtrans, ytrans)* |
| `scale_transform(xs, ys)` | *Affine2D().scale(xs[, ys])* |
| `get_bbox_transform(boxin, boxout)` | *BboxTransform(boxin, boxout)* or *BboxTransformFrom(boxin)* or *BboxTransformTo(boxout)* |
| `Transform.seq_xy_tup(points)` | *Transform.transform(points)* |
| `Transform.inverse_xy_tup(points)` | *Transform.inverted()*.transform(points) |

[1] The *Bbox* is bound by the points (x0, y0) to (x1, y1) and there is no defined order to these points, that is, x0 is not necessarily the left edge of the box. To get the left edge of the *Bbox*, use the read-only property *xmin*.

### matplotlib.axes

| Old method | New method |
|---|---|
| `Axes.get_position()` | *matplotlib.axes.Axes.get_position()*[2] |
| `Axes.set_position()` | *matplotlib.axes.Axes.set_position()*[3] |
| `Axes.toggle_log_lineary()` | *matplotlib.axes.Axes.set_yscale()*[4] |
| `Subplot` class | removed |

The `Polar` class has moved to *matplotlib.projections.polar*.

### matplotlib.artist

| Old method | New method |
|---|---|
| `Artist.set_clip_path(path)` | `Artist.set_clip_path(path, transform)`[5] |

### matplotlib.collections

| Old method | New method |
|---|---|
| *linestyle* | *linestyles*[6] |

### matplotlib.colors

| Old method | New method |
|---|---|
| `ColorConvertor.to_rgba_list(c)` | `colors.to_rgba_array(c)` [*matplotlib.colors.to_rgba_array()* returns an Nx4 NumPy array of RGBA color quadruples.] |

[2] *matplotlib.axes.Axes.get_position()* used to return a list of points, now it returns a *matplotlib.transforms.Bbox* instance.

[3] *matplotlib.axes.Axes.set_position()* now accepts either four scalars or a *matplotlib.transforms.Bbox* instance.

[4] Since the refactoring allows for more than two scale types ('log' or 'linear'), it no longer makes sense to have a toggle. `Axes.toggle_log_lineary()` has been removed.

[5] *matplotlib.artist.Artist.set_clip_path()* now accepts a *matplotlib.path.Path* instance and a *matplotlib.transforms.Transform* that will be applied to the path immediately before clipping.

[6] Linestyles are now treated like all other collection attributes, i.e. a single value or multiple values may be provided.

### matplotlib.contour

| Old method | New method |
|---|---|
| `Contour._segments` | `matplotlib.contour.Contour.get_paths` [Returns a list of *matplotlib.path.Path* instances.] |

### matplotlib.figure

| Old method | New method |
|---|---|
| `Figure.dpi.get()` `Figure.dpi.set()` | *matplotlib.figure.Figure.dpi (a property)* |

### matplotlib.patches

| Old method | New method |
|---|---|
| `Patch.get_verts()` | *matplotlib.patches.Patch.get_path()* [Returns a *matplotlib.path.Path* instance] |

### matplotlib.backend_bases

| Old method | New method |
|---|---|
| `GraphicsContext.set_clip_rectangle(tuple)` | *GraphicsContext.set_clip_rectangle(bbox)* |
| `GraphicsContext.get_clip_path()` | *GraphicsContext.get_clip_path()*[7] |
| `GraphicsContext.set_clip_path()` | *GraphicsContext.set_clip_path()*[8] |

[7] *matplotlib.backend_bases.GraphicsContextBase.get_clip_path()* returns a tuple of the form (*path*, *affine_transform*), where *path* is a *matplotlib.path.Path* instance and *affine_transform* is a *matplotlib.transforms.Affine2D* instance.

[8] *matplotlib.backend_bases.GraphicsContextBase.set_clip_path()* now only accepts a *matplotlib.transforms.TransformedPath* instance.

#### RendererBase

New methods:

- *draw_path(self, gc, path, transform, rgbFace)*
- *draw_markers(self, gc, marker_path, marker_trans, path, trans, rgbFace)*
- *draw_path_collection(self, master_transform, cliprect, clippath, clippath_trans, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds)* *[optional]*

Changed methods:

- `draw_image(self, x, y, im, bbox)` is now *draw_image(self, x, y, im, bbox, clippath, clippath_trans)*

Removed methods:

- `draw_arc`
- `draw_line_collection`
- `draw_line`
- `draw_lines`
- `draw_point`
- `draw_quad_mesh`
- `draw_poly_collection`
- `draw_polygon`
- `draw_rectangle`
- `draw_regpoly_collection`

### 9.20.9 Changes for 0.91.2

- For `csv2rec`, checkrows=0 is the new default indicating all rows will be checked for type inference
- A warning is issued when an image is drawn on log-scaled axes, since it will not log-scale the image data.
- Moved `rec2gtk` to `matplotlib.toolkits.gtktools`
- Moved `rec2excel` to `matplotlib.toolkits.exceltools`
- Removed, dead/experimental ExampleInfo, Namespace and Importer code from *matplotlib*

### 9.20.10 Changes for 0.91.0

- Changed `cbook.is_file_like` to `cbook.is_writable_file_like` and corrected behavior.
- Added *ax* keyword argument to *`pyplot.colorbar()`* and *`Figure.colorbar()`* so that one can specify the axes object from which space for the colorbar is to be taken, if one does not want to make the colorbar axes manually.
- Changed `cbook.reversed` so it yields a tuple rather than a (index, tuple). This agrees with the Python reversed builtin, and cbook only defines reversed if Python doesn't provide the builtin.
- Made skiprows=1 the default on `csv2rec`
- The gd and paint backends have been deleted.
- The errorbar method and function now accept additional kwargs so that upper and lower limits can be indicated by capping the bar with a caret instead of a straight line segment.
- The *`matplotlib.dviread`* file now has a parser for files like psfonts.map and pdftex.map, to map TeX font names to external files.
- The file `matplotlib.type1font` contains a new class for Type 1 fonts. Currently it simply reads pfa and pfb format files and stores the data in a way that is suitable for embedding in pdf files. In the future the class might actually parse the font to allow e.g., subsetting.
- `matplotlib.ft2font` now supports `FT_Attach_File`. In practice this can be used to read an afm file in addition to a pfa/pfb file, to get metrics and kerning information for a Type 1 font.
- The `AFM` class now supports querying CapHeight and stem widths. The get_name_char method now has an isord kwarg like get_width_char.
- Changed *`pcolor()`* default to `shading='flat'`; but as noted now in the docstring, it is preferable to simply use the *edgecolor* keyword argument.
- The mathtext font commands (`\cal`, `\rm`, `\it`, `\tt`) now behave as TeX does: they are in effect until the next font change command or the end of the grouping. Therefore uses of `$\cal{R}$` should be changed to `${\cal R}$`. Alternatively, you may use the new LaTeX-style font commands (`\mathcal`, `\mathrm`, `\mathit`, `\mathtt`) which do affect the following group, e.g., `$\mathcal{R}$`.
- Text creation commands have a new default linespacing and a new `linespacing` kwarg, which is a multiple of the maximum vertical extent of a line of ordinary text. The default is 1.2; `linespacing=2` would be like ordinary double spacing, for example.
- Changed default kwarg in *`matplotlib.colors.Normalize`* to `clip=False`; clipping silently defeats the purpose of the special over, under, and bad values in the colormap, thereby leading to unexpected behavior. The new default should reduce such surprises.
- Made the emit property of *`set_xlim()`* and *`set_ylim()`* `True` by default; removed the Axes custom callback handling into a 'callbacks' attribute which is a *`CallbackRegistry`* instance. This now supports the 'xlim_changed' and 'ylim_changed' Axes events.

### 9.20.11 Changes for 0.90.1

```
The file dviread.py has a (very limited and fragile) dvi reader
for usetex support. The API might change in the future so don't
depend on it yet.

Removed deprecated support for a float value as a gray-scale;
now it must be a string, like '0.5'.  Added alpha kwarg to
ColorConverter.to_rgba_list.

New method set_bounds(vmin, vmax) for formatters, locators sets
the viewInterval and dataInterval from floats.

Removed deprecated colorbar_classic.

Line2D.get_xdata and get_ydata valid_only=False kwarg is replaced
by orig=True.  When True, it returns the original data, otherwise
the processed data (masked, converted)

Some modifications to the units interface.
units.ConversionInterface.tickers renamed to
units.ConversionInterface.axisinfo and it now returns a
units.AxisInfo object rather than a tuple.  This will make it
easier to add axis info functionality (e.g., I added a default label
on this iteration) w/o having to change the tuple length and hence
the API of the client code every time new functionality is added.
Also, units.ConversionInterface.convert_to_value is now simply
named units.ConversionInterface.convert.

Axes.errorbar uses Axes.vlines and Axes.hlines to draw its error
limits int he vertical and horizontal direction.  As you'll see
in the changes below, these functions now return a LineCollection
rather than a list of lines.  The new return signature for
errorbar is  ylins, caplines, errorcollections where
errorcollections is a xerrcollection, yerrcollection

Axes.vlines and Axes.hlines now create and returns a LineCollection, not a␣
 ↪list
of lines.  This is much faster.  The kwarg signature has changed,
so consult the docs

MaxNLocator accepts a new Boolean kwarg ('integer') to force
ticks to integer locations.

Commands that pass an argument to the Text constructor or to
Text.set_text() now accept any object that can be converted
with '%s'.  This affects xlabel(), title(), etc.

Barh now takes a **kwargs dict instead of most of the old
arguments. This helps ensure that bar and barh are kept in sync,
but as a side effect you can no longer pass e.g., color as a
positional argument.
```

(continues on next page)

(continued from previous page)

```
ft2font.get_charmap() now returns a dict that maps character codes
to glyph indices (until now it was reversed)

Moved data files into lib/matplotlib so that setuptools' develop
mode works. Re-organized the mpl-data layout so that this source
structure is maintained in the installation. (i.e., the 'fonts' and
'images' sub-directories are maintained in site-packages.).
Suggest removing site-packages/matplotlib/mpl-data and
~/.matplotlib/ttffont.cache before installing
```

### 9.20.12 Changes for 0.90.0

```
All artists now implement a "pick" method which users should not
call.  Rather, set the "picker" property of any artist you want to
pick on (the epsilon distance in points for a hit test) and
register with the "pick_event" callback.  See
examples/pick_event_demo.py for details

Bar, barh, and hist have "log" binary kwarg: log=True
sets the ordinate to a log scale.

Boxplot can handle a list of vectors instead of just
an array, so vectors can have different lengths.

Plot can handle 2-D x and/or y; it plots the columns.

Added linewidth kwarg to bar and barh.

Made the default Artist._transform None (rather than invoking
identity_transform for each artist only to have it overridden
later).  Use artist.get_transform() rather than artist._transform,
even in derived classes, so that the default transform will be
created lazily as needed

New LogNorm subclass of Normalize added to colors.py.
All Normalize subclasses have new inverse() method, and
the __call__() method has a new clip kwarg.

Changed class names in colors.py to match convention:
normalize -> Normalize, no_norm -> NoNorm.  Old names
are still available for now.

Removed obsolete pcolor_classic command and method.

Removed lineprops and markerprops from the Annotation code and
replaced them with an arrow configurable with kwarg arrowprops.
See examples/annotation_demo.py - JDH
```

### 9.20.13 Changes for 0.87.7

```
Completely reworked the annotations API because I found the old
API cumbersome.  The new design is much more legible and easy to
read.  See matplotlib.text.Annotation and
examples/annotation_demo.py

markeredgecolor and markerfacecolor cannot be configured in
matplotlibrc any more. Instead, markers are generally colored
automatically based on the color of the line, unless marker colors
are explicitly set as kwargs - NN

Changed default comment character for load to '#' - JDH

math_parse_s_ft2font_svg from mathtext.py & mathtext2.py now returns
width, height, svg_elements. svg_elements is an instance of Bunch (
cmbook.py) and has the attributes svg_glyphs and svg_lines, which are both
lists.

Renderer.draw_arc now takes an additional parameter, rotation.
It specifies to draw the artist rotated in degrees anti-
clockwise.  It was added for rotated ellipses.

Renamed Figure.set_figsize_inches to Figure.set_size_inches to
better match the get method, Figure.get_size_inches.

Removed the copy_bbox_transform from transforms.py; added
shallowcopy methods to all transforms.  All transforms already
had deepcopy methods.

FigureManager.resize(width, height): resize the window
specified in pixels

barh: x and y args have been renamed to width and bottom
respectively, and their order has been swapped to maintain
a (position, value) order.

bar and barh: now accept kwarg 'edgecolor'.

bar and barh: The left, height, width and bottom args can
now all be scalars or sequences; see docstring.

barh: now defaults to edge aligned instead of center
aligned bars

bar, barh and hist: Added a keyword arg 'align' that
controls between edge or center bar alignment.

Collections: PolyCollection and LineCollection now accept
vertices or segments either in the original form [(x,y),
(x,y), ...] or as a 2D numerix array, with X as the first column
and Y as the second. Contour and quiver output the numerix
```

(continues on next page)

(continued from previous page)

```
form.  The transforms methods Bbox.update() and
Transformation.seq_xy_tups() now accept either form.

Collections: LineCollection is now a ScalarMappable like
PolyCollection, etc.

Specifying a grayscale color as a float is deprecated; use
a string instead, e.g., 0.75 -> '0.75'.

Collections: initializers now accept any mpl color arg, or
sequence of such args; previously only a sequence of rgba
tuples was accepted.

Colorbar: completely new version and api; see docstring.  The
original version is still accessible as colorbar_classic, but
is deprecated.

Contourf: "extend" kwarg replaces "clip_ends"; see docstring.
Masked array support added to pcolormesh.

Modified aspect-ratio handling:
    Removed aspect kwarg from imshow
    Axes methods:
        set_aspect(self, aspect, adjustable=None, anchor=None)
        set_adjustable(self, adjustable)
        set_anchor(self, anchor)
    Pylab interface:
        axis('image')

 Backend developers: ft2font's load_char now takes a flags
 argument, which you can OR together from the LOAD_XXX
 constants.
```

### 9.20.14 Changes for 0.86

```
Matplotlib data is installed into the matplotlib module.
This is similar to package_data.  This should get rid of
having to check for many possibilities in _get_data_path().
The MATPLOTLIBDATA env key is still checked first to allow
for flexibility.

1) Separated the color table data from cm.py out into
a new file, _cm.py, to make it easier to find the actual
code in cm.py and to add new colormaps. Everything
from _cm.py is imported by cm.py, so the split should be
transparent.
2) Enabled automatic generation of a colormap from
a list of colors in contour; see modified
examples/contour_demo.py.
3) Support for imshow of a masked array, with the
```

(continues on next page)

(continued from previous page)

```
ability to specify colors (or no color at all) for
masked regions, and for regions that are above or
below the normally mapped region.  See
examples/image_masked.py.
4) In support of the above, added two new classes,
ListedColormap, and no_norm, to colors.py, and modified
the Colormap class to include common functionality. Added
a clip kwarg to the normalize class.
```

### 9.20.15 Changes for 0.85

```
Made xtick and ytick separate props in rc

made pos=None the default for tick formatters rather than 0 to
indicate "not supplied"

Removed "feature" of minor ticks which prevents them from
overlapping major ticks.  Often you want major and minor ticks at
the same place, and can offset the major ticks with the pad.  This
could be made configurable

Changed the internal structure of contour.py to a more OO style.
Calls to contour or contourf in axes.py or pylab.py now return
a ContourSet object which contains references to the
LineCollections or PolyCollections created by the call,
as well as the configuration variables that were used.
The ContourSet object is a "mappable" if a colormap was used.

Added a clip_ends kwarg to contourf. From the docstring:
         * clip_ends = True
           If False, the limits for color scaling are set to the
           minimum and maximum contour levels.
           True (default) clips the scaling limits.  Example:
           if the contour boundaries are V = [-100, 2, 1, 0, 1, 2, 100],
           then the scaling limits will be [-100, 100] if clip_ends
           is False, and [-3, 3] if clip_ends is True.
Added kwargs linewidths, antialiased, and nchunk to contourf.  These
are experimental; see the docstring.

Changed Figure.colorbar():
    kw argument order changed;
    if mappable arg is a non-filled ContourSet, colorbar() shows
            lines instead hof polygons.
    if mappable arg is a filled ContourSet with clip_ends=True,
            the endpoints are not labelled, so as to give the
            correct impression of open-endedness.

Changed LineCollection.get_linewidths to get_linewidth, for
consistency.
```

### 9.20.16 Changes for 0.84

```
Unified argument handling between hlines and vlines.  Both now
take optionally a fmt argument (as in plot) and a keyword args
that can be passed onto Line2D.

Removed all references to "data clipping" in rc and lines.py since
these were not used and not optimized.  I'm sure they'll be
resurrected later with a better implementation when needed.

'set' removed - no more deprecation warnings.  Use 'setp' instead.

Backend developers: Added flipud method to image and removed it
from to_str.  Removed origin kwarg from backend.draw_image.
origin is handled entirely by the frontend now.
```

### 9.20.17 Changes for 0.83

```
- Made HOME/.matplotlib the new config dir where the matplotlibrc
  file, the ttf.cache, and the tex.cache live.  The new default
  filenames in .matplotlib have no leading dot and are not hidden.
  e.g., the new names are matplotlibrc, tex.cache, and ttffont.cache.
  This is how ipython does it so it must be right.

  If old files are found, a warning is issued and they are moved to
  the new location.

- backends/__init__.py no longer imports new_figure_manager,
  draw_if_interactive and show from the default backend, but puts
  these imports into a call to pylab_setup.  Also, the Toolbar is no
  longer imported from WX/WXAgg.  New usage:

    from backends import pylab_setup
    new_figure_manager, draw_if_interactive, show = pylab_setup()

- Moved Figure.get_width_height() to FigureCanvasBase. It now
  returns int instead of float.
```

### 9.20.18 Changes for 0.82

```
- toolbar import change in GTKAgg, GTKCairo and WXAgg

- Added subplot config tool to GTK* backends -- note you must now
  import the NavigationToolbar2 from your backend of choice rather
  than from backend_gtk because it needs to know about the backend
  specific canvas -- see examples/embedding_in_gtk2.py.  Ditto for
  wx backend -- see examples/embedding_in_wxagg.py
```

(continues on next page)

(continued from previous page)

```
- hist bin change

    Sean Richards notes there was a problem in the way we created
    the binning for histogram, which made the last bin
    underrepresented.  From his post:

      I see that hist uses the linspace function to create the bins
      and then uses searchsorted to put the values in their correct
      bin. That's all good but I am confused over the use of linspace
      for the bin creation. I wouldn't have thought that it does
      what is needed, to quote the docstring it creates a "Linear
      spaced array from min to max". For it to work correctly
      shouldn't the values in the bins array be the same bound for
      each bin? (i.e. each value should be the lower bound of a
      bin). To provide the correct bins for hist would it not be
      something like

      def bins(xmin, xmax, N):
        if N==1: return xmax
        dx = (xmax-xmin)/N # instead of N-1
        return xmin + dx*arange(N)

     This suggestion is implemented in 0.81.  My test script with these
     changes does not reveal any bias in the binning

      from matplotlib.numerix.mlab import randn, rand, zeros, Float
      from matplotlib.mlab import hist, mean

      Nbins = 50
      Ntests = 200
      results = zeros((Ntests,Nbins), typecode=Float)
      for i in range(Ntests):
          print 'computing', i
          x = rand(10000)
          n, bins = hist(x, Nbins)
          results[i] = n
      print mean(results)
```

### 9.20.19 Changes for 0.81

```
- pylab and artist "set" functions renamed to setp to avoid clash
  with python2.4 built-in set.  Current version will issue a
  deprecation warning which will be removed in future versions

- imshow interpolation arguments changes for advanced interpolation
  schemes.  See help imshow, particularly the interpolation,
  filternorm and filterrad kwargs
```

(continues on next page)

(continued from previous page)

```
- Support for masked arrays has been added to the plot command and
  to the Line2D object.  Only the valid points are plotted.  A
  "valid_only" kwarg was added to the get_xdata() and get_ydata()
  methods of Line2D; by default it is False, so that the original
  data arrays are returned. Setting it to True returns the plottable
  points.

- contour changes:

  Masked arrays: contour and contourf now accept masked arrays as
    the variable to be contoured.  Masking works correctly for
    contour, but a bug remains to be fixed before it will work for
    contourf.  The "badmask" kwarg has been removed from both
    functions.

   Level argument changes:

     Old version: a list of levels as one of the positional
     arguments specified the lower bound of each filled region; the
     upper bound of the last region was taken as a very large
     number.  Hence, it was not possible to specify that z values
     between 0 and 1, for example, be filled, and that values
     outside that range remain unfilled.

     New version: a list of N levels is taken as specifying the
     boundaries of N-1 z ranges.  Now the user has more control over
     what is colored and what is not.  Repeated calls to contourf
     (with different colormaps or color specifications, for example)
     can be used to color different ranges of z.  Values of z
     outside an expected range are left uncolored.

     Example:
       Old: contourf(z, [0, 1, 2]) would yield 3 regions: 0-1, 1-2, and >2.
       New: it would yield 2 regions: 0-1, 1-2.  If the same 3 regions were
       desired, the equivalent list of levels would be [0, 1, 2,
       1e38].
```

### 9.20.20 Changes for 0.80

```
- xlim/ylim/axis always return the new limits regardless of
  arguments.  They now take kwargs which allow you to selectively
  change the upper or lower limits while leaving unnamed limits
  unchanged.  See help(xlim) for example
```

### 9.20.21 Changes for 0.73

```
- Removed deprecated ColormapJet and friends

- Removed all error handling from the verbose object

- figure num of zero is now allowed
```

### 9.20.22 Changes for 0.72

```
- Line2D, Text, and Patch copy_properties renamed update_from and
  moved into artist base class

- LineCollections.color renamed to LineCollections.set_color for
  consistency with set/get introspection mechanism,

- pylab figure now defaults to num=None, which creates a new figure
  with a guaranteed unique number

- contour method syntax changed - now it is MATLAB compatible

    unchanged: contour(Z)
    old: contour(Z, x=Y, y=Y)
    new: contour(X, Y, Z)

  see http://matplotlib.sf.net/matplotlib.pylab.html#-contour

 - Increased the default resolution for save command.

 - Renamed the base attribute of the ticker classes to _base to avoid conflict
   with the base method.  Sitt for subs

 - subs=none now does autosubbing in the tick locator.

 - New subplots that overlap old will delete the old axes.  If you
   do not want this behavior, use fig.add_subplot or the axes
   command
```

### 9.20.23 Changes for 0.71

```
Significant numerix namespace changes, introduced to resolve
namespace clashes between python built-ins and mlab names.
Refactored numerix to maintain separate modules, rather than
folding all these names into a single namespace.  See the following
mailing list threads for more information and background

  http://sourceforge.net/mailarchive/forum.php?thread_id=6398890&forum_
```

(continues on next page)

(continued from previous page)

```
 ↪id=36187
  http://sourceforge.net/mailarchive/forum.php?thread_id=6323208&forum_
 ↪id=36187

OLD usage

  from matplotlib.numerix import array, mean, fft

NEW usage

  from matplotlib.numerix import array
  from matplotlib.numerix.mlab import mean
  from matplotlib.numerix.fft import fft

numerix dir structure mirrors numarray (though it is an incomplete
implementation)

  numerix
  numerix/mlab
  numerix/linear_algebra
  numerix/fft
  numerix/random_array

but of course you can use 'numerix : Numeric' and still get the
symbols.

pylab still imports most of the symbols from Numerix, MLab, fft,
etc, but is more cautious.  For names that clash with python names
(min, max, sum), pylab keeps the builtins and provides the numeric
versions with an a* prefix, e.g., (amin, amax, asum)
```

### 9.20.24 Changes for 0.70

```
MplEvent factored into a base class Event and derived classes
MouseEvent and KeyEvent

Removed defunct set_measurement in wx toolbar
```

### 9.20.25 Changes for 0.65.1

```
removed add_axes and add_subplot from backend_bases.  Use
figure.add_axes and add_subplot instead.  The figure now manages the
current axes with gca and sca for get and set current axes.  If you
have code you are porting which called, e.g., figmanager.add_axes, you
can now simply do figmanager.canvas.figure.add_axes.
```

### 9.20.26 Changes for 0.65

```
mpl_connect and mpl_disconnect in the MATLAB interface renamed to
connect and disconnect

Did away with the text methods for angle since they were ambiguous.
fontangle could mean fontstyle (oblique, etc) or the rotation of the
text.  Use style and rotation instead.
```

### 9.20.27 Changes for 0.63

```
Dates are now represented internally as float days since 0001-01-01,
UTC.

All date tickers and formatters are now in matplotlib.dates, rather
than matplotlib.tickers

converters have been abolished from all functions and classes.
num2date and date2num are now the converter functions for all date
plots

Most of the date tick locators have a different meaning in their
constructors.  In the prior implementation, the first argument was a
base and multiples of the base were ticked.  e.g.,

  HourLocator(5)  # old: tick every 5 minutes

In the new implementation, the explicit points you want to tick are
provided as a number or sequence

   HourLocator(range(0,5,61))  # new: tick every 5 minutes

This gives much greater flexibility.  I have tried to make the
default constructors (no args) behave similarly, where possible.

Note that YearLocator still works under the base/multiple scheme.
The difference between the YearLocator and the other locators is
that years are not recurrent.

Financial functions:

  matplotlib.finance.quotes_historical_yahoo(ticker, date1, date2)

   date1, date2 are now datetime instances.  Return value is a list
   of quotes where the quote time is a float - days since gregorian
   start, as returned by date2num

   See examples/finance_demo.py for example usage of new API
```

### 9.20.28 Changes for 0.61

```
canvas.connect is now deprecated for event handling.  use
mpl_connect and mpl_disconnect instead.  The callback signature is
func(event) rather than func(widget, event)
```

### 9.20.29 Changes for 0.60

```
ColormapJet and Grayscale are deprecated.  For backwards
compatibility, they can be obtained either by doing

  from matplotlib.cm import ColormapJet

or

  from matplotlib.matlab import *

They are replaced by cm.jet and cm.grey
```

### 9.20.30 Changes for 0.54.3

```
removed the set_default_font / get_default_font scheme from the
font_manager to unify customization of font defaults with the rest of
the rc scheme.  See examples/font_properties_demo.py and help(rc) in
matplotlib.matlab.
```

### 9.20.31 Changes for 0.54

#### MATLAB interface

#### dpi

Several of the backends used a PIXELS_PER_INCH hack that I added to try and make images render consistently across backends. This just complicated matters. So you may find that some font sizes and line widths appear different than before. Apologies for the inconvenience. You should set the dpi to an accurate value for your screen to get true sizes.

### pcolor and scatter

There are two changes to the MATLAB interface API, both involving the patch drawing commands. For efficiency, pcolor and scatter have been rewritten to use polygon collections, which are a new set of objects from matplotlib.collections designed to enable efficient handling of large collections of objects. These new collections make it possible to build large scatter plots or pcolor plots with no loops at the python level, and are significantly faster than their predecessors. The original pcolor and scatter functions are retained as pcolor_classic and scatter_classic.

The return value from pcolor is a PolyCollection. Most of the properties that are available on rectangles or other patches are also available on PolyCollections, e.g., you can say:

```
c = scatter(blah, blah)
c.set_linewidth(1.0)
c.set_facecolor('r')
c.set_alpha(0.5)
```

or:

```
c = scatter(blah, blah)
set(c, 'linewidth', 1.0, 'facecolor', 'r', 'alpha', 0.5)
```

Because the collection is a single object, you no longer need to loop over the return value of scatter or pcolor to set properties for the entire list.

If you want the different elements of a collection to vary on a property, e.g., to have different line widths, see matplotlib.collections for a discussion on how to set the properties as a sequence.

For scatter, the size argument is now in points^2 (the area of the symbol in points) as in MATLAB and is not in data coords as before. Using sizes in data coords caused several problems. So you will need to adjust your size arguments accordingly or use scatter_classic.

### mathtext spacing

For reasons not clear to me (and which I'll eventually fix) spacing no longer works in font groups. However, I added three new spacing commands which compensate for this " (regular space), '/' (small space) and 'hspace{frac}' where frac is a fraction of fontsize in points. You will need to quote spaces in font strings, is:

```
title(r'$\rm{Histogram\ of\ IQ:}\ \mu=100,\ \sigma=15$')
```

### Object interface - Application programmers

#### Autoscaling

The x and y axis instances no longer have autoscale view. These are handled by axes.autoscale_view

#### Axes creation

You should not instantiate your own Axes any more using the OO API. Rather, create a Figure as before and in place of:

```
f = Figure(figsize=(5,4), dpi=100)
a = Subplot(f, 111)
f.add_axis(a)
```

use:

```
f = Figure(figsize=(5,4), dpi=100)
a = f.add_subplot(111)
```

That is, add_axis no longer exists and is replaced by:

```
add_axes(rect, axisbg=defaultcolor, frameon=True)
add_subplot(num, axisbg=defaultcolor, frameon=True)
```

#### Artist methods

If you define your own Artists, you need to rename the _draw method to draw

#### Bounding boxes

matplotlib.transforms.Bound2D is replaced by matplotlib.transforms.Bbox. If you want to construct a bbox from left, bottom, width, height (the signature for Bound2D), use matplotlib.transforms.lbwh_to_bbox, as in:

```
bbox = clickBBox = lbwh_to_bbox(left, bottom, width, height)
```

The Bbox has a different API than the Bound2D. e.g., if you want to get the width and height of the bbox

**OLD**:

```
width  = fig.bbox.x.interval()
height = fig.bbox.y.interval()
```

**NEW**:

```
width  = fig.bbox.width()
height = fig.bbox.height()
```

### Object constructors

You no longer pass the bbox, dpi, or transforms to the various Artist constructors. The old way or creating lines and rectangles was cumbersome because you had to pass so many attributes to the Line2D and Rectangle classes not related directly to the geometry and properties of the object. Now default values are added to the object when you call axes.add_line or axes.add_patch, so they are hidden from the user.

If you want to define a custom transformation on these objects, call o.set_transform(trans) where trans is a Transformation instance.

In prior versions of you wanted to add a custom line in data coords, you would have to do:

```
l = Line2D(dpi, bbox, x, y,
           color = color,
           transx = transx,
           transy = transy,
           )
```

now all you need is:

```
l = Line2D(x, y, color=color)
```

and the axes will set the transformation for you (unless you have set your own already, in which case it will eave it unchanged)

### Transformations

The entire transformation architecture has been rewritten. Previously the x and y transformations where stored in the xaxis and yaxis instances. The problem with this approach is it only allows for separable transforms (where the x and y transformations don't depend on one another). But for cases like polar, they do. Now transformations operate on x,y together. There is a new base class matplotlib.transforms.Transformation and two concrete implementations, matplotlib.transforms.SeparableTransformation and matplotlib.transforms.Affine. The SeparableTransformation is constructed with the bounding box of the input (this determines the rectangular coordinate system of the input, i.e., the x and y view limits), the bounding box of the display, and possibly nonlinear transformations of x and y. The 2 most frequently used transformations, data coordinates -> display and axes coordinates -> display are available as ax.transData and ax.transAxes. See alignment_demo.py which uses axes coords.

Also, the transformations should be much faster now, for two reasons

- they are written entirely in extension code
- because they operate on x and y together, they can do the entire transformation in one loop. Earlier I did something along the lines of:

```
xt = sx*func(x) + tx
yt = sy*func(y) + ty
```

Although this was done in numerix, it still involves 6 length(x) for-loops (the multiply, add, and function evaluation each for x and y). Now all of that is done in a single pass.

If you are using transformations and bounding boxes to get the cursor position in data coordinates, the method calls are a little different now. See the updated examples/coords_demo.py which shows you how to do this.

Likewise, if you are using the artist bounding boxes to pick items on the canvas with the GUI, the bbox methods are somewhat different. You will need to see the updated examples/object_picker.py.

See unit/transforms_unit.py for many examples using the new transformations.

### 9.20.32 Changes for 0.50

```
* refactored Figure class so it is no longer backend dependent.
  FigureCanvasBackend takes over the backend specific duties of the
  Figure.  matplotlib.backend_bases.FigureBase moved to
  matplotlib.figure.Figure.

* backends must implement FigureCanvasBackend (the thing that
  controls the figure and handles the events if any) and
  FigureManagerBackend (wraps the canvas and the window for MATLAB
  interface).  FigureCanvasBase implements a backend switching
  mechanism

* Figure is now an Artist (like everything else in the figure) and
  is totally backend independent

* GDFONTPATH renamed to TTFPATH

* backend faceColor argument changed to rgbFace

* colormap stuff moved to colors.py

* arg_to_rgb in backend_bases moved to class ColorConverter in
  colors.py

* GD users must upgrade to gd-2.0.22 and gdmodule-0.52 since new gd
  features (clipping, antialiased lines) are now used.

* Renderer must implement points_to_pixels

Migrating code:

MATLAB interface:

  The only API change for those using the MATLAB interface is in how
  you call figure redraws for dynamically updating figures.  In the
  old API, you did
```

(continues on next page)

(continued from previous page)

```
    fig.draw()

  In the new API, you do

    manager = get_current_fig_manager()
    manager.canvas.draw()

  See the examples system_monitor.py, dynamic_demo.py, and anim.py

API

  There is one important API change for application developers.
  Figure instances used subclass GUI widgets that enabled them to be
  placed directly into figures.  e.g., FigureGTK subclassed
  gtk.DrawingArea.  Now the Figure class is independent of the
  backend, and FigureCanvas takes over the functionality formerly
  handled by Figure.  In order to include figures into your apps,
  you now need to do, for example

    # gtk example
    fig = Figure(figsize=(5,4), dpi=100)
    canvas = FigureCanvasGTK(fig)  # a gtk.DrawingArea
    canvas.show()
    vbox.pack_start(canvas)

  If you use the NavigationToolbar, this in now initialized with a
  FigureCanvas, not a Figure.  The examples embedding_in_gtk.py,
  embedding_in_gtk2.py, and mpl_with_glade.py all reflect the new
  API so use these as a guide.

  All prior calls to

   figure.draw()  and
   figure.print_figure(args)

  should now be

   canvas.draw()  and
   canvas.print_figure(args)

  Apologies for the inconvenience.  This refactorization brings
  significant more freedom in developing matplotlib and should bring
  better plotting capabilities, so I hope the inconvenience is worth
  it.
```

### 9.20.33 Changes for 0.42

```
* Refactoring AxisText to be backend independent.  Text drawing and
  get_window_extent functionality will be moved to the Renderer.

* backend_bases.AxisTextBase is now text.Text module

* All the erase and reset functionality removed from AxisText - not
  needed with double buffered drawing.  Ditto with state change.
  Text instances have a get_prop_tup method that returns a hashable
  tuple of text properties which you can use to see if text props
  have changed, e.g., by caching a font or layout instance in a dict
  with the prop tup as a key -- see RendererGTK.get_pango_layout in
  backend_gtk for an example.

* Text._get_xy_display renamed Text.get_xy_display

* Artist set_renderer and wash_brushes methods removed

* Moved Legend class from matplotlib.axes into matplotlib.legend

* Moved Tick, XTick, YTick, Axis, XAxis, YAxis from matplotlib.axes
  to matplotlib.axis

* moved process_text_args to matplotlib.text

* After getting Text handled in a backend independent fashion, the
  import process is much cleaner since there are no longer cyclic
  dependencies

* matplotlib.matlab._get_current_fig_manager renamed to
  matplotlib.matlab.get_current_fig_manager to allow user access to
  the GUI window attribute, e.g., figManager.window for GTK and
  figManager.frame for wx
```

### 9.20.34 Changes for 0.40

```
- Artist
    * __init__ takes a DPI instance and a Bound2D instance which is
      the bounding box of the artist in display coords
    * get_window_extent returns a Bound2D instance
    * set_size is removed; replaced by bbox and dpi
    * the clip_gc method is removed.  Artists now clip themselves with
      their box
    * added _clipOn boolean attribute.  If True, gc clip to bbox.

- AxisTextBase
    * Initialized with a transx, transy which are Transform instances
    * set_drawing_area removed
    * get_left_right and get_top_bottom are replaced by get_window_extent
```

(continues on next page)

(continued from previous page)

```
- Line2D Patches now take transx, transy
    * Initialized with a transx, transy which are Transform instances

- Patches
   * Initialized with a transx, transy which are Transform instances

- FigureBase attributes dpi is a DPI instance rather than scalar and
  new attribute bbox is a Bound2D in display coords, and I got rid
  of the left, width, height, etc... attributes.  These are now
  accessible as, for example, bbox.x.min is left, bbox.x.interval()
  is width, bbox.y.max is top, etc...

- GcfBase attribute pagesize renamed to figsize

- Axes
    * removed figbg attribute
    * added fig instance to __init__
    * resizing is handled by figure call to resize.

- Subplot
    * added fig instance to __init__

- Renderer methods for patches now take gcEdge and gcFace instances.
  gcFace=None takes the place of filled=False

- True and False symbols provided by cbook in a python2.3 compatible
  way

- new module transforms supplies Bound1D, Bound2D and Transform
  instances and more

- Changes to the MATLAB helpers API

  * _matlab_helpers.GcfBase is renamed by Gcf.  Backends no longer
    need to derive from this class.  Instead, they provide a factory
    function new_figure_manager(num, figsize, dpi).  The destroy
    method of the GcfDerived from the backends is moved to the derived
    FigureManager.

  * FigureManagerBase moved to backend_bases

  * Gcf.get_all_figwins renamed to Gcf.get_all_fig_managers

Jeremy:

  Make sure to self._reset = False in AxisTextWX._set_font.  This was
  something missing in my backend code.
```

# Part V

# Contribute

Matplotlib is a community project maintained for and by its users.

There are many ways you can help!

CHAPTER

TEN

# CONTRIBUTE

**Important:** If you plan to contribute to Matplotlib, please read the development version of this document as it will have the most up to date installation instructions, workflow process, and contributing guidelines.

Thank you for your interest in helping to improve Matplotlib!

There are various ways to contribute: optimizing and refactoring code, detailing unclear documentation and writing new examples, helping the community, reporting and fixing bugs and requesting and implementing new features...

**Submit a bug report**

We have preloaded the issue creation page with a Markdown form that you can use to provide relevant context. Thank you for your help in keeping bug reports complete, targeted and descriptive.

Report a bug

**Request a new feature**

We will give feedback on the feature proposal. Since Matplotlib is an open source project with limited resources, we encourage users to then also *participate in the implementation*.

Request a feature

We welcome you to get more involved with the Matplotlib project! If you are new to contributing, we recommend that you first read our *contributing guide*. If you are contributing code or documentation, please follow our guides for setting up and managing a *development environment and workflow*. For code, documentation, or triage, please follow the corresponding *contribution guidelines*.

## 10.1 New contributors

### 10.1.1 Contribute

You've discovered a bug or something else you want to change in Matplotlib — excellent!

You've worked out a way to fix it — even better!

You want to tell us about it — best of all!

This project is a community effort, and everyone is welcome to contribute. Everyone within the community is expected to abide by our code of conduct.

Below, you can find a number of ways to contribute, and how to connect with the Matplotlib community.

### Get started

There is no pre-defined pathway for new contributors -- we recommend looking at existing issue and pull request discussions, and following the conversations during pull request reviews to get context. Or you can deep-dive into a subset of the code-base to understand what is going on.

### Do I really have something to contribute to Matplotlib?

100% yes! There are so many ways to contribute to our community. Take a look at the following sections to learn more.

There are a few typical new contributor profiles:

- **You are a Matplotlib user, and you see a bug, a potential improvement, or something that annoys you, and you can fix it.**

  You can search our issue tracker for an existing issue that describes your problem or open a new issue to inform us of the problem you observed and discuss the best approach to fix it. If your contributions would not be captured on GitHub (social media, communication, educational content), you can also reach out to us on gitter, Discourse or attend any of our community meetings.

- **You are not a regular Matplotlib user but a domain expert: you know about visualization, 3D plotting, design, technical writing, statistics, or some other field where Matplotlib could be improved.**

  Awesome -- you have a focus on a specific application and domain and can start there. In this case, maintainers can help you figure out the best implementation; open an issue or pull request with a starting point, and we'll be happy to discuss technical approaches.

  If you prefer, you can use the GitHub functionality for "draft" pull requests and request early feedback on whatever you are working on, but you should be aware that maintainers may not review your contribution unless it has the "Ready to review" state on GitHub.

- **You are new to Matplotlib, both as a user and contributor, and want to start contributing but have yet to develop a particular interest.**

  Having some previous experience or relationship with the library can be very helpful when making open-source contributions. It helps you understand why things are the way they are and how they *should* be. Having first-hand experience and context is valuable both for what you can bring to the conversation (and given the breadth of Matplotlib's usage, there is a good chance it is a unique context in any given conversation) and make it easier to understand where other people are coming from.

  Understanding the entire codebase is a long-term project, and nobody expects you to do this right away. If you are determined to get started with Matplotlib and want to learn, going through the basic

functionality, choosing something to focus on (3d, testing, documentation, animations, etc.) and gaining context on this area by reading the issues and pull requests touching these subjects is a reasonable approach.

### Code

You want to implement a feature or fix a bug or help with maintenance - much appreciated! Our library source code is found in:

- Python library code: `lib/`
- C-extension code: `src/`
- Tests: `lib/matplotlib/tests/`

Because many people use and work on Matplotlib, we have guidelines for keeping our code consistent and mitigating the impact of changes.

- *Coding guidelines*
- *API guidelines*
- *Pull request guidelines*

Code is contributed through pull requests, so we recommend that you start at *Start a pull request* If you get stuck, please reach out on the *Contributor incubator*

### Documentation

You as an end-user of Matplotlib can make a valuable contribution because you more clearly see the potential for improvement than a core developer. For example, you can:

- Fix a typo
- Clarify a docstring
- Write or update an *example plot*
- Write or update a comprehensive *tutorial*

Our code is documented inline in the source code files in `matplotlib/lib`. Our website structure mirrors our folder structure, meaning that a narrative document's URL roughly corresponds to its location in our folder structure:

using the library

- `galleries/plot_types/`
- `users/getting_started/`
- `galleries/user_explain/`
- `galleries/tutorials/`
- `galleries/examples/`

- `doc/api/`

information about the library

- `doc/install/`
- `doc/project/`
- `doc/devel/`
- `doc/users/resources/index.rst`
- `doc/users/faq.rst`

Other documentation is generated from the following external sources:

- matplotlib.org homepage: https://github.com/matplotlib/mpl-brochure-site
- cheat sheets: https://github.com/matplotlib/cheatsheets
- third party packages: https://github.com/matplotlib/mpl-third-party

Instructions and guidelines for contributing documentation are found in:

- *Write documentation*
- *Documentation style guide*
- *Guidelines for assigning tags to gallery examples*

Documentation is contributed through pull requests, so we recommend that you start at *Start a pull request*. If that feels intimidating, we encourage you to open an issue describing what improvements you would make. If you get stuck, please reach out on the *Contributor incubator*

### Community

Matplotlib's community is built by its members, if you would like to help out see our *Community management guide*.

It helps us if you spread the word: reference the project from your blog and articles or link to it from your website!

If Matplotlib contributes to a project that leads to a scientific publication, please cite us following the *Citing Matplotlib* guidelines.

If you have developed an extension to Matplotlib, please consider adding it to our third party package list.

### Get connected

When in doubt, we recommend going together! Get connected with our community of active contributors, many of whom felt just like you when they started out and are happy to welcome you and support you as you get to know how we work, and where things are.

### Contributor incubator

The incubator is our non-public communication channel for new contributors. It is a private gitter (chat) room moderated by core Matplotlib developers where you can get guidance and support for your first few PRs. It's a place where you can ask questions about anything: how to use git, GitHub, how our PR review process works, technical questions about the code, what makes for good documentation or a blog post, how to get involved in community work, or get a "pre-review" on your PR.

To join, please go to our public community channel, and ask to be added to `#incubator`. One of our core developers will see your message and will add you.

### New Contributors Meeting

Once a month, we host a meeting to discuss topics that interest new contributors. Anyone can attend, present, or sit in and listen to the call. Among our attendees are fellow new contributors, as well as maintainers, and veteran contributors, who are keen to support onboarding of new folks and share their experience. You can find our community calendar link at the Scientific Python website, and you can browse previous meeting notes on GitHub. We recommend joining the meeting to clarify any doubts, or lingering questions you might have, and to get to know a few of the people behind the GitHub handles □. You can reach out to us on gitter for any clarifications or suggestions. We □ feedback!

### Work on an issue

In general, the Matplotlib project does not assign issues. Issues are "assigned" or "claimed" by opening a PR; there is no other assignment mechanism. If you have opened such a PR, please comment on the issue thread to avoid duplication of work. Please check if there is an existing PR for the issue you are addressing. If there is, try to work with the author by submitting reviews of their code or commenting on the PR rather than opening a new PR; duplicate PRs are subject to being closed. However, if the existing PR is an outline, unlikely to work, or stalled, and the original author is unresponsive, feel free to open a new PR referencing the old one.

### Good first issues

While any contributions are welcome, we have marked some issues as particularly suited for new contributors by the label good first issue. These are well documented issues, that do not require a deep understanding of the internals of Matplotlib. The issues may additionally be tagged with a difficulty. `Difficulty: Easy` is suited for people with little Python experience. `Difficulty: Medium` and `Difficulty: Hard` require more programming experience. This could be for a variety of reasons, among them, though not necessarily all at the same time:

- The issue is in areas of the code base which have more interdependencies, or legacy code.
- It has less clearly defined tasks, which require some independent exploration, making suggestions, or follow-up discussions to clarify a good path to resolve the issue.
- It involves Python features such as decorators and context managers, which have subtleties due to our implementation decisions.

### Start a pull request

The preferred way to contribute to Matplotlib is to fork the main repository on GitHub, then submit a "pull request" (PR). You can do this by cloning a copy of the Maplotlib repository to your own computer, or alternatively using GitHub Codespaces, a cloud-based in-browser development environment that comes with the appropriated setup to contribute to Matplotlib.

### Workflow overview

A brief overview of the workflow is as follows.

1. Create an account on GitHub if you do not already have one.
2. Fork the project repository by clicking on the **Fork** button near the top of the page. This creates a copy of the code under your account on the GitHub server.
3. Set up a development environment:

#### Local development

Clone this copy to your local disk:

```
git clone https://github.com/<YOUR GITHUB USERNAME>/matplotlib.git
```

### Using GitHub Codespaces

Check out the Matplotlib repository and activate your development environment:

1. Open codespaces on your fork by clicking on the green "Code" button on the GitHub web interface and selecting the "Codespaces" tab.
2. Next, click on "Open codespaces on <your branch name>". You will be able to change branches later, so you can select the default `main` branch.
3. After the codespace is created, you will be taken to a new browser tab where you can use the terminal to activate a pre-defined conda environment called `mpl-dev`:

   ```
   conda activate mpl-dev
   ```

4. Install the local version of Matplotlib with:

   ```
   python -m pip install --no-build-isolation --editable .[dev]
   ```

   See *Setting up Matplotlib for development* for detailed instructions.

5. Create a branch to hold your changes:

   ```
   git checkout -b my-feature origin/main
   ```

   and start making changes. Never work in the `main` branch!

6. Work on this task using Git to do the version control. Codespaces persist for some time (check the documentation for details) and can be managed on https://github.com/codespaces. When you're done editing e.g., `lib/matplotlib/collections.py`, do:

   ```
   git add lib/matplotlib/collections.py
   git commit
   ```

   to record your changes in Git, then push them to your GitHub fork with:

   ```
   git push -u origin my-feature
   ```

### GitHub Codespaces workflows

If you need to open a GUI window with Matplotlib output on Codespaces, our configuration includes a lightweight Fluxbox-based desktop. You can use it by connecting to this desktop via your web browser. To do this:

1. **Press `F1` or `Ctrl/Cmd+Shift+P` and select**

   `Ports: Focus on Ports View` in the VSCode session to bring it into focus. Open the ports view in your tool, select the `noVNC` port, and click the Globe icon.

2. **In the browser that appears, click the Connect button and enter the desktop**

   password (`vscode` by default).

Check the GitHub instructions for more details on connecting to the desktop.

#### View documentation

If you also built the documentation pages, you can view them using Codespaces. Use the "Extensions" icon in the activity bar to install the "Live Server" extension. Locate the `doc/build/html` folder in the Explorer, right click the file you want to open and select "Open with Live Server."

#### Open a pull request on Matplotlib

Finally, go to the web page of *your fork* of the Matplotlib repo, and click **Compare & pull request** to send your changes to the maintainers for review. The base repository is `matplotlib/matplotlib` and the base branch is generally `main`. For more guidance, see GitHub's pull request tutorial.

For more detailed instructions on how to set up Matplotlib for development and best practices for contribution, see *Setting up Matplotlib for development* and *Development workflow*.

## 10.2 Development environment

**Install**

### 10.2.1 Setting up Matplotlib for development

To set up Matplotlib for development follow these steps:

- *Fork the Matplotlib repository*
- *Retrieve the latest version of the code*
- *Create a dedicated environment*
- *Install Dependencies*

- *Install Matplotlib in editable mode*
  - *Build options*
- *Verify the Installation*
- *Install pre-commit hooks*

### Fork the Matplotlib repository

Matplotlib is hosted at https://github.com/matplotlib/matplotlib.git. If you plan on solving issues or submitting pull requests to the main Matplotlib repository, you should first *fork* this repository by visiting https://github.com/matplotlib/matplotlib.git and clicking on the `Fork` button on the top right of the page. See the GitHub documentation for more details.

### Retrieve the latest version of the code

Now that your fork of the repository lives under your GitHub username, you can retrieve the most recent version of the source code with one of the following commands (replace `<your-username>` with your GitHub username):

#### https

```
git clone https://github.com/<your-username>/matplotlib.git
```

#### ssh

```
git clone git@github.com:<your-username>/matplotlib.git
```

This requires you to setup an SSH key in advance, but saves you from typing your password at every connection.

This will place the sources in a directory `matplotlib` below your current working directory and set the remote name `origin` to point to your fork. Change into this directory before continuing:

```
cd matplotlib
```

Now set the remote name `upstream` to point to the Matplotlib main repository:

#### https

```
git remote add upstream https://github.com/matplotlib/matplotlib.git
```

#### ssh

```
git remote add upstream git@github.com:matplotlib/matplotlib.git
```

You can now use `upstream` to retrieve the most current snapshot of the source code, as described in *Development workflow*.

### Additional `git` and `GitHub` resources

For more information on `git` and `GitHub`, see:

- Git documentation
- GitHub-Contributing to a Project
- GitHub Skills
- Git for development
- Additional Git Resources
- Installing git
- Managing remote repositories
- https://tacaswell.github.io/think-like-git.html
- https://tom.preston-werner.com/2009/05/19/the-git-parable.html

### Create a dedicated environment

You should set up a dedicated environment to decouple your Matplotlib development from other Python and Matplotlib installations on your system.

The simplest way to do this is to use either Python's virtual environment venv or conda.

#### venv environment

Create a new venv environment with

```
python -m venv <file folder location>
```

and activate it with one of the following

```
source <file folder location>/bin/activate  # Linux/macOS
<file folder location>\Scripts\activate.bat  # Windows cmd.exe
<file folder location>\Scripts\Activate.ps1  # Windows PowerShell
```

On some systems, you may need to type `python3` instead of `python`. For a discussion of the technical reasons, see PEP-394.

Install the Python dependencies with

```
pip install -r requirements/dev/dev-requirements.txt
```

### conda environment

Create a new conda environment and install the Python dependencies with

```
conda env create -f environment.yml
```

You can use `mamba` instead of `conda` in the above command if you have mamba installed.

Activate the environment using

```
conda activate mpl-dev
```

Remember to activate the environment whenever you start working on Matplotlib.

### Install Dependencies

Most Python dependencies will be installed when *setting up the environment* but non-Python dependencies like C++ compilers, LaTeX, and other system applications must be installed separately.

### Install Matplotlib in editable mode

Install Matplotlib in editable mode from the `matplotlib` directory using the command

```
python -m pip install --verbose --no-build-isolation --editable ".[dev]"
```

The 'editable/develop mode' builds everything and places links in your Python environment so that Python will be able to import Matplotlib from your development source directory. This allows you to import your modified version of Matplotlib without having to re-install after changing a `.py` or compiled extension file.

When working on a branch that does not have Meson enabled, meaning it does not have PR #26621 in its history (log), you will have to reinstall from source each time you change any compiled extension code.

If the installation is not working, please consult the *troubleshooting guide*. If the guide does not offer a solution, please reach out via chat or *open an issue*.

### Build options

If you are working heavily with files that need to be compiled, you may want to inspect the compilation log. This can be enabled by setting the environment variable `MESONPY_EDITABLE_VERBOSE` or by setting the `editable-verbose` config during installation

```
python -m pip install --no-build-isolation --config-settings=editable-
 ↪verbose=true --editable .
```

For more information on installation and other configuration options, see the Meson Python editable installs guide.

For a list of the other environment variables you can set before install, see *Environment variables*.

### Verify the Installation

Run the following command to make sure you have correctly installed Matplotlib in editable mode. The command should be run when the virtual environment is activated:

```
python -c "import matplotlib; print(matplotlib.__file__)"
```

This command should return : `<matplotlib_local_repo>\lib\matplotlib\__init__.py`

We encourage you to run tests and build docs to verify that the code installed correctly and that the docs build cleanly, so that when you make code or document related changes you are aware of the existing issues beforehand.

- Run test cases to verify installation *Testing*
- Verify documentation build *Write documentation*

### Install pre-commit hooks

pre-commit hooks save time in the review process by identifying issues with the code before a pull request is formally opened. Most hooks can also aide in fixing the errors, and the checks should have corresponding *development workflow* and *pull request* guidelines. Hooks are configured in .pre-commit-config.yaml and include checks for spelling and formatting, flake 8 conformity, accidentally committed files, import order, and incorrect branching.

Install pre-commit hooks

```
python -m pip install pre-commit
pre-commit install
```

Hooks are run automatically after the `git commit` stage of the *editing workflow*. When a hook has found and fixed an error in a file, that file must be *staged and committed* again.

Hooks can also be run manually. All the hooks can be run, in order as listed in `.pre-commit-config.yaml`, against the full codebase with

```
pre-commit run --all-files
```

To run a particular hook manually, run `pre-commit run` with the hook id

```
pre-commit run <hook id> --all-files
```

**Workflow**

### 10.2.2 Development workflow

#### Workflow summary

To keep your work well organized, with readable history, and in turn make it easier for project maintainers (that might be you) to see what you've done, and why you did it, we recommend the following:

- Don't make changes in your local `main` branch!
- Before starting a new set of changes, fetch all changes from `upstream/main`, and start a new *feature branch* from that.
- Make a new branch for each feature or bug fix — "one task, one branch".
- Name your branch for the purpose of the changes - e.g. `bugfix-for-issue-14` or `refactor-database-code`.
- If you get stuck, reach out on Gitter or discourse.
- When you're ready or need feedback on your code, open a pull request so that the Matplotlib developers can give feedback and eventually include your suggested code into the `main` branch.

#### Update the `main` branch

First make sure you have followed *Setting up Matplotlib for development*.

From time to time you should fetch the upstream changes from GitHub:

```
git fetch upstream
```

This will pull down any commits you don't have, and set the remote branches to point to the right commit.

#### Make a new feature branch

When you are ready to make some changes to the code, you should start a new branch. Branches that are for a collection of related edits are often called 'feature branches'.

Making a new branch for each set of related changes will make it easier for someone reviewing your branch to see what you are doing.

Choose an informative name for the branch to remind yourself and the rest of us what the changes in the branch are for. For example `add-ability-to-fly`, or `bugfix-for-issue-42`.

```
# Update the main branch
git fetch upstream
# Make new feature branch starting at current main
git branch my-new-feature upstream/main
git checkout my-new-feature
```

If you started making changes on your local `main` branch, you can convert the branch to a feature branch by renaming it:

```
git branch -m <newname>
```

Generally, you will want to keep your feature branches on your public GitHub fork of Matplotlib. To do this, you `git push` this new branch up to your GitHub repo. Generally, if you followed the instructions in these pages, and by default, git will have a link to your fork of the GitHub repo, called `origin`. You push up to your own fork with:

```
git push origin my-new-feature
```

In git >= 1.7 you can ensure that the link is correctly set by using the `--set-upstream` option:

```
git push --set-upstream origin my-new-feature
```

From now on git will know that `my-new-feature` is related to the `my-new-feature` branch in the GitHub repo.

If you first opened the pull request from your `main` branch and then converted it to a feature branch, you will need to close the original pull request and open a new pull request from the renamed branch. See GitHub: working with branches.

### The editing workflow

1. Make some changes
2. Save the changes
3. See which files have changed with `git status`. You'll see a listing like this one:

```
# On branch ny-new-feature
# Changed but not updated:
#   (use "git add <file>..." to update what will be committed)
#   (use "git checkout -- <file>..." to discard changes in working␣
 ↪directory)
#
#  modified:   README
#
# Untracked files:
#   (use "git add <file>..." to include in what will be committed)
#
#  INSTALL
no changes added to commit (use "git add" and/or "git commit -a")
```

4. Check what the actual changes are with `git diff`.
5. Add any new files to version control `git add new_file_name`.
6. To commit **all** modified files into the local copy of your repo, type:

   ```
   git commit -am 'A commit message'
   ```

   Note the `-am` options to `commit`. The `m` flag signals that you are going to type a message on the command line. The `a` flag stages every file that has been modified, except files listed in `.gitignore`. For more information, see why the -a flag? and the git commit manual page.
7. To push the changes up to your forked repo on GitHub, do a `git push`.

### Open a pull request

When you are ready to ask for someone to review your code and consider a merge, submit your Pull Request (PR).

Enter a title for the set of changes with some explanation of what you've done. Mention anything you'd like particular attention for - such as a complicated change or some code you are not happy with.

If you don't think your request is ready to be merged, just say so in your pull request message and use the "Draft PR" feature of GitHub. This is a good way of getting some preliminary code review.

### Update a pull request

When updating your pull request after making revisions, instead of adding new commits, please consider amending your initial commit(s) to keep the commit history clean.

You can achieve this by using

```
git commit -a --amend --no-edit
git push [your-remote-repo] [your-branch] --force-with-lease
```

### Manage commit history

### Explore your repository

To see a graphical representation of the repository branches and commits:

```
gitk --all
```

To see a linear list of commits for this branch:

```
git log
```

### Recover from mistakes

Sometimes, you mess up merges or rebases. Luckily, in git it is relatively straightforward to recover from such mistakes.

If you mess up during a rebase:

```
git rebase --abort
```

If you notice you messed up after the rebase:

```
# reset branch back to the saved point
git reset --hard tmp
```

If you forgot to make a backup branch:

```
# look at the reflog of the branch
git reflog show cool-feature

8630830 cool-feature@{0}: commit: BUG: io: close file handles immediately
278dd2a cool-feature@{1}: rebase finished: refs/heads/my-feature-branch onto␣
 ↪11ee694744f2552d
26aa21a cool-feature@{2}: commit: BUG: lib: make seek_gzip_factory not leak␣
 ↪gzip obj
...

# reset the branch to where it was before the botched rebase
git reset --hard cool-feature@{2}
```

### Rewrite commit history

---

**Note:** Do this only for your own feature branches.

---

Is there an embarrassing typo in a commit you made? Or perhaps you made several false starts you don't want posterity to see.

This can be done via *interactive rebasing*.

Suppose that the commit history looks like this:

```
git log --oneline
eadc391 Fix some remaining bugs
a815645 Modify it so that it works
2dec1ac Fix a few bugs + disable
13d7934 First implementation
6ad92e5 * masked is now an instance of a new object, MaskedConstant
29001ed Add pre-nep for a copule of structured_array_extensions.
...
```

and `6ad92e5` is the last commit in the `cool-feature` branch. Suppose we want to make the following changes:

- Rewrite the commit message for `13d7934` to something more sensible.
- Combine the commits `2dec1ac`, `a815645`, `eadc391` into a single one.

We do as follows:

```
# make a backup of the current state
git branch tmp HEAD
# interactive rebase
git rebase -i 6ad92e5
```

This will open an editor with the following text in it:

```
pick 13d7934 First implementation
pick 2dec1ac Fix a few bugs + disable
pick a815645 Modify it so that it works
pick eadc391 Fix some remaining bugs

# Rebase 6ad92e5..eadc391 onto 6ad92e5
#
# Commands:
#  p, pick = use commit
#  r, reword = use commit, but edit the commit message
#  e, edit = use commit, but stop for amending
#  s, squash = use commit, but meld into previous commit
#  f, fixup = like "squash", but discard this commit's log message
#
# If you remove a line here THAT COMMIT WILL BE LOST.
# However, if you remove everything, the rebase will be aborted.
#
```

To achieve what we want, we will make the following changes to it:

```
r 13d7934 First implementation
pick 2dec1ac Fix a few bugs + disable
f a815645 Modify it so that it works
f eadc391 Fix some remaining bugs
```

This means that (i) we want to edit the commit message for `13d7934`, and (ii) collapse the last three commits into one. Now we save and quit the editor.

Git will then immediately bring up an editor for editing the commit message. After revising it, we get the output:

```
[detached HEAD 721fc64] FOO: First implementation
 2 files changed, 199 insertions(+), 66 deletions(-)
[detached HEAD 0f22701] Fix a few bugs + disable
 1 files changed, 79 insertions(+), 61 deletions(-)
Successfully rebased and updated refs/heads/my-feature-branch.
```

and now, the history looks like this:

```
0f22701 Fix a few bugs + disable
721fc64 ENH: Sophisticated feature
6ad92e5 * masked is now an instance of a new object, MaskedConstant
```

If it went wrong, recovery is again possible as explained *above*.

If you have not yet pushed this branch to github, you can carry on as normal, however if you *have* already pushed this commit see *Push with force* for how to replace your already published commits with the new ones.

### Rebase onto `upstream/main`

Let's say you thought of some work you'd like to do. You *Update the main branch* and *Make a new feature branch* called `cool-feature`. At this stage, `main` is at some commit, let's call it E. Now you make some new commits on your `cool-feature` branch, let's call them A, B, C. Maybe your changes take a while, or you come back to them after a while. In the meantime, `main` has progressed from commit E to commit (say) G:

```
      A---B---C cool-feature
     /
D---E---F---G main
```

At this stage you consider merging `main` into your feature branch, and you remember that this page sternly advises you not to do that, because the history will get messy. Most of the time, you can just ask for a review without worrying about whether `main` has got a little ahead; however sometimes, the changes in `main` might affect your changes, and you need to harmonize them. In this situation you may prefer to do a rebase.

`rebase` takes your changes (A, B, C) and replays them as if they had been made to the current state of `main`. In other words, in this case, it takes the changes represented by A, B, C and replays them on top of G. After the rebase, your history will look like this:

```
              A'--B'--C' cool-feature
             /
D---E---F---G main
```

See rebase without tears for more detail.

To do a rebase on `upstream/main`:

```
# Fetch changes from upstream/main
git fetch upstream
# go to the feature branch
git checkout cool-feature
# make a backup in case you mess up
git branch tmp cool-feature
# rebase cool-feature onto main
git rebase --onto upstream/main upstream/main cool-feature
```

In this situation, where you are already on branch `cool-feature`, the last command can be written more succinctly as:

```
git rebase upstream/main
```

When all looks good, you can delete your backup branch:

```
git branch -D tmp
```

If it doesn't look good you may need to have a look at *Recover from mistakes*.

If you have made changes to files that have also changed in `main`, this may generate merge conflicts that you need to resolve - see the git rebase man page for some instructions at the end of the "Description" section. There is some related help on merging in the git user manual - see resolving a merge.

If you have not yet pushed this branch to github, you can carry on as normal, however if you *have* already pushed this commit see *Push with force* for how to replace your already published commits with the new ones.

### Push with force

If you have in some way re-written already pushed history (e.g. via *Rewrite commit history* or *Rebase onto upstream/main*) leaving you with a git history that looks something like

```
  A'--E cool-feature
 /
D---A---B---C origin/cool-feature
```

where you have pushed the commits `A,B,C` to your fork on GitHub (under the remote name *origin*) but now have the commits `A'` and `E` on your local branch *cool-feature*. If you try to push the new commits to GitHub, it will fail and show an error that looks like

```
$ git push
Pushing to github.com:origin/matplotlib.git
To github.com:origin/matplotlib.git
 ! [rejected]              cool_feature -> cool_feature (non-fast-forward)
error: failed to push some refs to 'github.com:origin/matplotlib.git'
hint: Updates were rejected because the tip of your current branch is behind
hint: its remote counterpart. Integrate the remote changes (e.g.
hint: 'git pull ...') before pushing again.
hint: See the 'Note about fast-forwards' in 'git push --help' for details.
```

If this push had succeeded, the commits `A`, `B`, and `C` would no longer be referenced by any branch and they would be discarded:

```
D---A'---E cool-feature, origin/cool-feature
```

By default `git push` helpfully tries to protect you from accidentally discarding commits by rejecting the push to the remote. When this happens, GitHub also adds the helpful suggestion to pull the remote changes and then try pushing again. In some cases, such as if you and a colleague are both committing and pushing to the same branch, this is a correct course of action.

However, in the case of having intentionally re-written history, we *want* to discard the commits on the remote and replace them with the new-and-improved versions from our local branch. In this case, what we want to do is

```
$ git push --force-with-lease
```

which tells git you are aware of the risks and want to do the push anyway. We recommend using `--force-with-lease` over the `--force` flag. The `--force` will do the push no matter what, whereas `--force-with-lease` will only do the push if the remote branch is where the local `git` client thought it was.

Be judicious with force-pushing. It is effectively re-writing published history, and if anyone has fetched the old commits, it will have a different view of history which can cause confusion.

### Automated tests

Whenever a pull request is created or updated, various automated test tools will run on all supported platforms and versions of Python.

- tox is not used in the automated testing. It is supported for testing locally.
- Codecov and CodeQL are currently for information only. Their failure is not necessarily a blocker.

Make sure the Linting, GitHub Actions, AppVeyor, CircleCI, and Azure pipelines are passing before merging. All checks are listed at the bottom of the GitHub page of your pull request.

| Name | Check | Tips for finding cause of failure |
|---|---|---|
| Linting | *code style* | Errors are displayed as annotations on the pull request diff. |
| Mypy | *static type hints* | Errors are displayed as annotations on the pull request diff. |
| Stubtest | | |
| CircleCI | *documentation build* | Search the CircleCI log for `WARNING`. |
| | *tests* | |
| GitHub Actions<br>AppVeyor<br>Azure pipelines | | Search the log for `FAILURES`. Subsequent section should contain information on failed tests.<br><br>On Azure, find the images as *artifacts* of the Azure job:<br>1. Click *Details* on the check on the GitHub PR page.<br>2. Click *View more details on Azure Pipelines* to go to Azure.<br>3. On the overview page *artifacts* are listed in the section *Related*. |

#### Skip CI checks

If you know only a subset of CI checks need to be run, you can skip unneeded CI checks on individual commits by including the following strings in the commit message:

| String | Effect | Notes |
|---|---|---|
| `[ci doc]` | Only run documentation checks. | For when you have only changed documentation. `[ci doc]` is applied automatically when the changes are only to files in `doc/**/` or `galleries/**/` |
| `[skip doc]` | Skip documentation checks. | For when you didn't change documentation. |
| `[skip appveyor]` | Skip AppVeyor run. | Substring must be in first line of commit message. |
| `[skip azp]` | Skip Azure Pipelines. | |
| `[skip actions]` | Skip GitHub Actions. | |
| `[skip ci]` | Skip all CI checks. | Use only for changes where documentation checks and unit tests do not apply. |

`[skip actions]` and `[skip ci]` only skip Github Actions CI workflows that are triggered on `on: push` and `on: pull_request` events. For more information, see Skipping workflow runs.

### 10.2.3 Troubleshooting

For guidance on debugging an installation, see *Frequently asked questions*.

#### Problems with git

First, make sure you have a clean build and install (see *How to completely remove Matplotlib*), get the latest git update, install it and run a simple test script in debug mode:

```
rm -rf /path/to/site-packages/matplotlib*
git clean -xfd
git pull
python -m pip install -v . > build.out
python -c "from pylab import *; set_loglevel('debug'); plot(); show()" > run.
↪out
```

and post `build.out` and `run.out` to the matplotlib-devel mailing list (please do not post git problems to the users list).

Of course, you will want to clearly describe your problem, what you are expecting and what you are getting, but often a clean build and install will help. See also *Get help*.

#### Unlink of file `*/_c_internal_utils.cp311-win_amd64.pyd` failed

The DLL files may be loaded by multiple running instances of Matplotlib; therefore check that Matplotlib is not running in any other application before trying to unlink this file. Multiple versions of Matplotlib can be linked to the same DLL, for example a development version installed in a development conda environment and a stable version running in a Jupyter notebook. To resolve this error, fully close all running instances of Matplotlib.

#### Windows compilation errors

If the compiled extensions are not building on Windows due to errors in linking to Windows' header files, for example `../../src/_tkagg.cpp:133:10: error: 'WM_DPICHANGED' was not declared in this scope`, you should check which compiler Meson is using:

```
Build type: native build
Project name: matplotlib
Project version: 3.9.0.dev0
C compiler for the host machine: cc (gcc 7.2.0 "cc (Rev1, Built by MSYS2␣
↪project) 7.2.0")
C linker for the host machine: cc ld.bfd 2.29.1
C++ compiler for the host machine: c++ (gcc 7.2.0 "c++ (Rev1, Built by MSYS2␣
↪project) 7.2.0")
C++ linker for the host machine: c++ ld.bfd 2.29.1
```

Our *dependencies* documentation lists the minimum header version if you intended to use `MSYS2`. If you intended to use `MSVC` then you may need to force Meson to use MSVC.

## 10.3 Policies and guidelines

**Code**

### 10.3.1 Coding guidelines

We appreciate these guidelines being followed because it improves the readability, consistency, and maintainability of the code base.

---

**API guidelines**

If adding new features, changing behavior or function signatures, or removing public interfaces, please consult the *API guidelines*.

---

### PEP8, as enforced by flake8

Formatting should follow the recommendations of PEP8, as enforced by flake8. Matplotlib modifies PEP8 to extend the maximum line length to 88 characters. You can check flake8 compliance from the command line with

```
python -m pip install flake8
flake8 /path/to/module.py
```

or your editor may provide integration with it. Note that Matplotlib intentionally does not use the black auto-formatter (1), in particular due to its inability to understand the semantics of mathematical expressions (2, 3).

### Package imports

Import the following modules using the standard scipy conventions:

```
import numpy as np
import numpy.ma as ma
import matplotlib as mpl
import matplotlib.pyplot as plt
import matplotlib.cbook as cbook
import matplotlib.patches as mpatches
```

In general, Matplotlib modules should **not** import *rcParams* using `from matplotlib import rcParams`, but rather access it as `mpl.rcParams`. This is because some modules are imported very early, before the *rcParams* singleton is constructed.

### Variable names

When feasible, please use our internal variable naming convention for objects of a given class and objects of any child class:

| base class | variable | multiples |
|---|---|---|
| *FigureBase* | fig | |
| *Axes* | ax | |
| *Transform* | trans | trans_<source>_<target><br>trans_<source> when target is screen |

Generally, denote more than one instance of the same class by adding suffixes to the variable names. If a format isn't specified in the table, use numbers or letters as appropriate.

### Type hints

If you add new public API or change public API, update or add the corresponding mypy type hints. We generally use stub files (`*.pyi`) to store the type information; for example `colors.pyi` contains the type information for `colors.py`. A notable exception is `pyplot.py`, which is type hinted inline.

Type hints are checked by the mypy *pre-commit hook*, can often be verified by running `tox -e stubtest`.

### New modules and files: installation

- If you have added new files or directories, or reorganized existing ones, make sure the new files are included in the `meson.build` in the corresponding directories.
- New modules *may* be typed inline or using parallel stub file like existing modules.

### C/C++ extensions

- Extensions may be written in C or C++.
- Code style should conform to PEP7 (understanding that PEP7 doesn't address C++, but most of its admonitions still apply).
- Python/C interface code should be kept separate from the core C/C++ code. The interface code should be named `FOO_wrap.cpp` or `FOO_wrapper.cpp`.
- Header file documentation (aka docstrings) should be in Numpydoc format. We don't plan on using automated tools for these docstrings, and the Numpydoc format is well understood in the scientific Python community.
- C/C++ code in the `extern/` directory is vendored, and should be kept close to upstream whenever possible. It can be modified to fix bugs or implement new features only if the required changes cannot be made elsewhere in the codebase. In particular, avoid making style fixes to it.

### Keyword argument processing

Matplotlib makes extensive use of `**kwargs` for pass-through customizations from one function to another. A typical example is *`text`*. The definition of *`matplotlib.pyplot.text`* is a simple pass-through to *`matplotlib.axes.Axes.text`*:

```
# in pyplot.py
def text(x, y, s, fontdict=None, **kwargs):
    return gca().text(x, y, s, fontdict=fontdict, **kwargs)
```

*`matplotlib.axes.Axes.text`* (simplified for illustration) just passes all `args` and `kwargs` on to `matplotlib.text.Text.__init__`:

```
# in axes/_axes.py
def text(self, x, y, s, fontdict=None, **kwargs):
    t = Text(x=x, y=y, text=s, **kwargs)
```

and `matplotlib.text.Text.__init__` (again, simplified) just passes them on to the *`matplotlib.artist.Artist.update`* method:

```
# in text.py
def __init__(self, x=0, y=0, text='', **kwargs):
    super().__init__()
    self.update(kwargs)
```

`update` does the work looking for methods named like `set_property` if `property` is a keyword argument. i.e., no one looks at the keywords, they just get passed through the API to the artist constructor which looks for suitably named methods and calls them with the value.

As a general rule, the use of `**kwargs` should be reserved for pass-through keyword arguments, as in the example above. If all the keyword args are to be used in the function, and not passed on, use the key/value keyword args in the function definition rather than the `**kwargs` idiom.

In some cases, you may want to consume some keys in the local function, and let others pass through. Instead of popping arguments to use off `**kwargs`, specify them as keyword-only arguments to the local function. This makes it obvious at a glance which arguments will be consumed in the function. For example, in *`plot()`*, `scalex` and `scaley` are local arguments and the rest are passed on as *`Line2D()`* keyword arguments:

```
# in axes/_axes.py
def plot(self, *args, scalex=True, scaley=True, **kwargs):
    lines = []
    for line in self._get_lines(*args, **kwargs):
        self.add_line(line)
        lines.append(line)
```

### Using logging for debug messages

Matplotlib uses the standard Python `logging` library to write verbose warnings, information, and debug messages. Please use it! In all those places you write `print` calls to do your debugging, try using `logging.debug` instead!

To include `logging` in your module, at the top of the module, you need to `import logging`. Then calls in your code like:

```
_log = logging.getLogger(__name__)  # right after the imports

# code
# more code
_log.info('Here is some information')
_log.debug('Here is some more detailed information')
```

will log to a logger named `matplotlib.yourmodulename`.

If an end-user of Matplotlib sets up `logging` to display at levels more verbose than `logging.WARNING` in their code with the Matplotlib-provided helper:

```
plt.set_loglevel("debug")
```

or manually with

```
import logging
logging.basicConfig(level=logging.DEBUG)
import matplotlib.pyplot as plt
```

Then they will receive messages like

```
DEBUG:matplotlib.backends:backend MacOSX version unknown
DEBUG:matplotlib.yourmodulename:Here is some information
DEBUG:matplotlib.yourmodulename:Here is some more detailed information
```

Avoid using pre-computed strings (`f-strings`, `str.format`,etc.) for logging because of security and performance issues, and because they interfere with style handlers. For example, use `_log.error('hello %s', 'world')` rather than `_log.error('hello {}'.format('world'))` or `_log.error(f'hello {s}')`.

### Which logging level to use?

There are five levels at which you can emit messages.

- `logging.critical` and `logging.error` are really only there for errors that will end the use of the library but not kill the interpreter.
- `logging.warning` and *`_api.warn_external`* are used to warn the user, see below.
- `logging.info` is for information that the user may want to know if the program behaves oddly. They are not displayed by default. For instance, if an object isn't drawn because its position is `NaN`, that can usually be ignored, but a mystified user could call `logging.basicConfig(level=logging.INFO)` and get an error message that says why.
- `logging.debug` is the least likely to be displayed, and hence can be the most verbose. "Expected" code paths (e.g., reporting normal intermediate steps of layouting or rendering) should only log at this level.

By default, `logging` displays all log messages at levels higher than `logging.WARNING` to `sys.stderr`.

The logging tutorial suggests that the difference between `logging.warning` and *`_api.warn_external`* (which uses `warnings.warn`) is that *`_api.warn_external`* should be used for things the user must change to stop the warning (typically in the source), whereas `logging.warning` can be more persistent. Moreover, note that *`_api.warn_external`* will by default only emit a given warning *once* for each line of user code, whereas `logging.warning` will display the message every time it is called.

By default, `warnings.warn` displays the line of code that has the `warn` call. This usually isn't more informative than the warning message itself. Therefore, Matplotlib uses *`_api.warn_external`* which uses `warnings.warn`, but goes up the stack and displays the first line of code outside of Matplotlib. For example, for the module:

```
# in my_matplotlib_module.py
import warnings

def set_range(bottom, top):
    if bottom == top:
        warnings.warn('Attempting to set identical bottom==top')
```

running the script:

```
from matplotlib import my_matplotlib_module
my_matplotlib_module.set_range(0, 0)  # set range
```

will display

```
UserWarning: Attempting to set identical bottom==top
warnings.warn('Attempting to set identical bottom==top')
```

Modifying the module to use *_api.warn_external*:

```
from matplotlib import _api

def set_range(bottom, top):
    if bottom == top:
        _api.warn_external('Attempting to set identical bottom==top')
```

and running the same script will display

```
UserWarning: Attempting to set identical bottom==top
my_matplotlib_module.set_range(0, 0)  # set range
```

### Licenses for contributed code

Matplotlib only uses BSD compatible code. If you bring in code from another project make sure it has a PSF, BSD, MIT or compatible license (see the Open Source Initiative licenses page for details on individual licenses). If it doesn't, you may consider contacting the author and asking them to relicense it. GPL and LGPL code are not acceptable in the main code base, though we are considering an alternative way of distributing L/GPL code through an separate channel, possibly a toolkit. If you include code, make sure you include a copy of that code's license in the license directory if the code's license requires you to distribute the license with it. Non-BSD compatible licenses are acceptable in Matplotlib toolkits (e.g., basemap), but make sure you clearly state the licenses you are using.

### Why BSD compatible?

The two dominant license variants in the wild are GPL-style and BSD-style. There are countless other licenses that place specific restrictions on code reuse, but there is an important difference to be considered in the GPL and BSD variants. The best known and perhaps most widely used license is the GPL, which in addition to granting you full rights to the source code including redistribution, carries with it an extra obligation. If you use GPL code in your own code, or link with it, your product must be released under a GPL compatible license. i.e., you are required to give the source code to other people and give them the right to redistribute it as well. Many of the most famous and widely used open source projects are released under the GPL, including linux, gcc, emacs and sage.

The second major class are the BSD-style licenses (which includes MIT and the python PSF license). These basically allow you to do whatever you want with the code: ignore it, include it in your own open source project, include it in your proprietary product, sell it, whatever. python itself is released under a BSD compatible license, in the sense that, quoting from the PSF license page:

```
There is no GPL-like "copyleft" restriction. Distributing
binary-only versions of Python, modified or not, is allowed. There
is no requirement to release any of your source code. You can also
write extension modules for Python and provide them only in binary
form.
```

Famous projects released under a BSD-style license in the permissive sense of the last paragraph are the BSD operating system, python and TeX.

There are several reasons why early Matplotlib developers selected a BSD compatible license. Matplotlib is a python extension, and we choose a license that was based on the python license (BSD compatible). Also, we wanted to attract as many users and developers as possible, and many software companies will not use GPL code in software they plan to distribute, even those that are highly committed to open source development, such as enthought, out of legitimate concern that use of the GPL will "infect" their code base by its viral nature. In effect, they want to retain the right to release some proprietary code. Companies and institutions who use Matplotlib often make significant contributions, because they have the resources to get a job done, even a boring one. Two of the Matplotlib backends (FLTK and WX) were contributed by private companies. The final reason behind the licensing choice is compatibility with the other python extensions for scientific computing: ipython, numpy, scipy, the enthought tool suite and python itself are all distributed under BSD compatible licenses.

### Licenses for contributed code

Matplotlib only uses BSD compatible code. If you bring in code from another project make sure it has a PSF, BSD, MIT or compatible license (see the Open Source Initiative licenses page for details on individual licenses). If it doesn't, you may consider contacting the author and asking them to relicense it. GPL and LGPL code are not acceptable in the main code base, though we are considering an alternative way of distributing L/GPL code through an separate channel, possibly a toolkit. If you include code, make sure you include a copy of that code's license in the license directory if the code's license requires you to distribute the license with it. Non-BSD compatible licenses are acceptable in Matplotlib toolkits (e.g., basemap), but make sure you clearly state the licenses you are using.

#### Why BSD compatible?

Two of the Matplotlib backends (FLTK and WX) were contributed by private companies. The final reason behind the licensing choice is compatibility with the other python extensions for scientific computing: ipython, numpy, scipy, the enthought tool suite and python itself are all distributed under BSD compatible licenses.

### 10.3.2 API guidelines

API consistency and stability are of great value; Therefore, API changes (e.g. signature changes, behavior changes, removals) will only be conducted if the added benefit is worth the effort of adapting existing code.

Because we are a visualization library, our primary output is the final visualization the user sees; therefore, the appearance of the figure is part of the API and any changes, either semantic or *aesthetic*, are backwards-incompatible API changes.

### Default color changes

As discussed at length elsewhere , `jet` is an empirically bad colormap and should not be the default colormap. Due to the position that changing the appearance of the plot breaks backward compatibility, this change has been put off for far longer than it should have been. In addition to changing the default color map we plan to take the chance to change the default color-cycle on plots and to adopt a different colormap for filled plots (`imshow`, `pcolor`, `contourf`, etc) and for scatter like plots.

### Default heat map colormap

The choice of a new colormap is fertile ground to bike-shedding ("No, it should be _this_ color") so we have a proposed set criteria (via Nathaniel Smith) to evaluate proposed colormaps.

- it should be a sequential colormap, because diverging colormaps are really misleading unless you know where the "center" of the data is, and for a default colormap we generally won't.
- it should be perceptually uniform, i.e., human subjective judgments of how far apart nearby colors are should correspond as linearly as possible to the difference between the numerical values they represent, at least locally.
- it should have a perceptually uniform luminance ramp, i.e. if you convert to greyscale it should still be uniform. This is useful both in practical terms (greyscale printers are still a thing!) and because luminance is a very strong and natural cue to magnitude.
- it should also have some kind of variation in hue, because hue variation is a really helpful additional cue to perception, having two cues is better than one, and there's no reason not to do it.
- the hue variation should be chosen to produce reasonable results even for viewers with the more common types of colorblindness. (Which rules out things like red-to-green.)
- For bonus points, it would be nice to choose a hue ramp that still works if you throw away the luminance variation, because then we could use the version with varying luminance for 2d plots, and the version with just hue variation for 3d plots. (In 3d plots you really want to reserve the luminance channel for lighting/shading, because your brain is *really* good at extracting 3d shape from luminance variation. If the 3d surface itself has massively varying luminance then this screws up the ability to see shape.)
- Not infringe any existing IP

### Example script

### Proposed colormaps

### Default scatter colormap

For heat-map like applications it can be desirable to cover as much of the luminance scale as possible, however when colormapping markers, having markers too close to white can be a problem. For that reason we propose using a different (but maybe related) colormap to the heat map for marker-based. The design parameters are the same as above, only with a more limited luminance variation.

### Example script

```
import numpy as np
import matplotlib.pyplot as plt

np.random.seed(1234)

fig, (ax1, ax2) = plt.subplots(1, 2)

N = 50
x = np.random.rand(N)
y = np.random.rand(N)
colors = np.random.rand(N)
area = np.pi * (15 * np.random.rand(N))**2  # 0 to 15 point radiuses

ax1.scatter(x, y, s=area, c=colors, alpha=0.5)

X,Y = np.meshgrid(np.arange(0, 2*np.pi, .2),
                  np.arange(0, 2*np.pi, .2))
U = np.cos(X)
V = np.sin(Y)
Q = ax2.quiver(X, Y, U, V, units='width')
qd = np.random.rand(np.prod(X.shape))
Q.set_array(qd)
```

## Proposed colormaps

### Color cycle / qualitative colormap

When plotting lines it is frequently desirable to plot multiple lines or artists which need to be distinguishable, but there is no inherent ordering.

### Example script

```
import numpy as np
import matplotlib.pyplot as plt

fig, (ax1, ax2) = plt.subplots(1, 2)

x = np.linspace(0, 1, 10)

for j in range(10):
    ax1.plot(x, x * j)

th = np.linspace(0, 2*np.pi, 1024)
```

(continues on next page)

(continued from previous page)

```
for j in np.linspace(0, np.pi, 10):
    ax2.plot(th, np.sin(th + j))

ax2.set_xlim(0, 2*np.pi)
```

### Proposed color cycle

### Add new API and features

Every new function, parameter and attribute that is not explicitly marked as private (i.e., starts with an underscore) becomes part of Matplotlib's public API. As discussed above, changing the existing API is cumbersome. Therefore, take particular care when adding new API:

- Mark helper functions and internal attributes as private by prefixing them with an underscore.
- Carefully think about good names for your functions and variables.
- Try to adopt patterns and naming conventions from existing parts of the Matplotlib API.
- Consider making as many arguments keyword-only as possible. See also API Evolution the Right Way -- Add Parameters Compatibly.

### Deprecate API

API changes in Matplotlib have to be performed following the deprecation process below, except in very rare circumstances as deemed necessary by the development team. Generally API deprecation happens in two stages:

- **introduce:** warn users that the API *will* change
- **expire:** API *is* changed as described in the introduction period

This ensures that users are notified before the change will take effect and thus prevents unexpected breaking of code.

### Rules

- Deprecations are targeted at the next *meso release* (e.g. 3.x)
- Deprecated API is generally removed (expired) two point-releases after introduction of the deprecation. Longer deprecations can be imposed by core developers on a case-by-case basis to give more time for the transition
- The old API must remain fully functional during the deprecation period
- If alternatives to the deprecated API exist, they should be available during the deprecation period
- If in doubt, decisions about API changes are finally made by the API consistency lead developer.

### Introduce deprecation

1. Create *deprecation notice*
2. If possible, issue a `MatplotlibDeprecationWarning` when the deprecated API is used. There are a number of helper tools for this:
   - Use `_api.warn_deprecated()` for general deprecation warnings
   - Use the decorator `@_api.deprecated` to deprecate classes, functions, methods, or properties
   - Use `@_api.deprecate_privatize_attribute` to annotate deprecation of attributes while keeping the internal private version.
   - To warn on changes of the function signature, use the decorators `@_api.delete_parameter`, `@_api.rename_parameter`, and `@_api.make_keyword_only`

   All these helpers take a first parameter *since*, which should be set to the next point release, e.g. "3.x".

   You can use standard rst cross references in *alternative*.
3. Make appropriate changes to the type hints in the associated `.pyi` file. The general guideline is to match runtime reported behavior.
   - Items marked with `@_api.deprecated` or `@_api.deprecate_privatize_attribute` are generally kept during the expiry period, and thus no changes are needed on introduction.
   - Items decorated with `@_api.rename_parameter` or `@_api.make_keyword_only` report the *new* (post deprecation) signature at runtime, and thus *should* be updated on introduction.
   - Items decorated with `@_api.delete_parameter` should include a default value hint for the deleted parameter, even if it did not previously have one (e.g. `param: <type> = ...`).

### Expire deprecation

1. Create *deprecation announcement*. For the content, you can usually copy the deprecation notice and adapt it slightly.
2. Change the code functionality and remove any related deprecation warnings.
3. Make appropriate changes to the type hints in the associated `.pyi` file.
   - Items marked with `@_api.deprecated` or `@_api.deprecate_privatize_attribute` are to be removed on expiry.
   - Items decorated with `@_api.rename_parameter` or `@_api.make_keyword_only` will have been updated at introduction, and require no change now.
   - Items decorated with `@_api.delete_parameter` will need to be updated to the final signature, in the same way as the `.py` file signature is updated.
   - Any entries in `ci/mypy-stubtest-allowlist.txt` which indicate a deprecation version should be double checked. In most cases this is not needed, though some items were never type

hinted in the first place and were added to this file instead. For removed items that were not in the stub file, only deleting from the allowlist is required.

### Announce new and deprecated API

When adding or changing the API in a backward in-compatible way, please add the appropriate *versioning directive* and document it for the release notes and add the entry to the appropriate folder:

| | versioning directive | announcement folder |
|---|---|---|
| new feature | `.. versionadded:: 3.N` | `doc/users/next_whats_new/` |
| API change | `.. versionchanged:: 3.N` | `doc/api/next_api_changes/[kind]` |

When deprecating API, please add a notice as described in the *deprecation guidelines* and summarized here:

| stage | announcement folder |
|---|---|
| *introduce deprecation* | `doc/api/next_api_changes/deprecation` |
| *expire deprecation* | `doc/api/next_api_changes/[kind]` |

Generally the introduction notices can be repurposed for the expiration notice as they are expected to be describing the same API changes and removals.

### Versioning directives

When making a backward incompatible change, please add a versioning directive in the docstring. The directives should be placed at the end of a description block. For example:

```
class Foo:
    """
    This is the summary.

    Followed by a longer description block.

    Consisting of multiple lines and paragraphs.

    .. versionadded:: 3.5

    Parameters
    ----------
    a : int
        The first parameter.
    b: bool, default: False
        This was added later.

        .. versionadded:: 3.6
    """
```

(continues on next page)

(continued from previous page)

```
    def set_b(b):
        """
        Set b.

        .. versionadded:: 3.6

        Parameters
        ----------
        b: bool
```

For classes and functions, the directive should be placed before the *Parameters* section. For parameters, the directive should be placed at the end of the parameter description. The micro release version is omitted and the directive should not be added to entire modules.

### Release notes

For both change notes and what's new, please avoid using cross-references in section titles as it causes links to be confusing in the table of contents. Instead, ensure that a cross-reference is included in the descriptive text.

### API change notes

API change notes for future releases are collected in `next_api_changes`. They are divided into four subdirectories:

- **Deprecations**: Announcements of future changes. Typically, these will raise a deprecation warning and users of this API should change their code to stay compatible with future releases of Matplotlib. If possible, state what should be used instead.
- **Removals**: Parts of the API that got removed. If possible, state what should be used instead.
- **Behaviour changes**: API that stays valid but will yield a different result.
- **Development changes**: Changes to the build process, dependencies, etc.

Please place new entries in these directories with a new file named `99999-ABC.rst`, where `99999` would be the PR number, and `ABC` the author's initials. Typically, each change will get its own file, but you may also amend existing files when suitable. The overall goal is a comprehensible documentation of the changes.

A typical entry could look like this:

```
Locators
~~~~~~~~
The unused `Locator.autoscale()` method is deprecated (pass the axis
limits to `Locator.view_limits()` instead).
```

#### What's new notes

Please place new portions of `whats_new.rst` in the `next_whats_new` directory.

When adding an entry please look at the currently existing files to see if you can extend any of them. If you create a file, name it something like `cool_new_feature.rst` if you have added a brand new feature or something like `updated_feature.rst` for extensions of existing features.

Include contents of the form:

```
Section title for feature
-------------------------

A bunch of text about how awesome the new feature is and examples of how
to use it.

A sub-section
~~~~~~~~~~~~~
```

### 10.3.3 Testing

Matplotlib uses the pytest framework.

The tests are in `lib/matplotlib/tests`, and customizations to the pytest testing infrastructure are in *`matplotlib.testing`*.

#### Requirements

To run the tests you will need to *set up Matplotlib for development*. Note in particular the *additional dependencies* for testing.

---

**Note:** We will assume that you want to run the tests in a development setup.

While you can run the tests against a regular installed version of Matplotlib, this is a far less common use case. You still need the *additional dependencies* for testing. You have to additionally get the reference images from the repository, because they are not distributed with pre-built Matplotlib packages.

---

#### Running the tests

In the root directory of your development repository run:

```
pytest
```

`pytest` can be configured via many command-line parameters. Some particularly useful ones are:

| | |
|---|---|
| `-v` or `--verbose` | Be more verbose |
| `-n NUM` | Run tests in parallel over NUM processes (requires pytest-xdist) |
| `--capture=no` or `-s` | Do not capture stdout |

To run a single test from the command line, you can provide a file path, optionally followed by the function separated by two colons, e.g., (tests do not need to be installed, but Matplotlib should be):

```
pytest lib/matplotlib/tests/test_simplification.py::test_clipping
```

If you want to use `pytest` as a module (via `python -m pytest`), then you will need to avoid clashes between `pytest`'s import mode and Python's search path:

- On more recent Python, you may `disable "unsafe import paths"` (i.e., stop adding the current directory to the import path) with the `-P` argument:

  ```
  python -P -m pytest
  ```

- On older Python, you may enable `isolated mode` (which stops adding the current directory to the import path, but has other repercussions):

  ```
  python -I -m pytest
  ```

- On any Python, set `pytest`'s import mode to the older `prepend` mode (but note that this will break `pytest`'s assert rewriting):

  ```
  python -m pytest --import-mode prepend
  ```

### Viewing image test output

The output of *image-based* tests is stored in a `result_images` directory. These images can be compiled into one HTML page, containing hundreds of images, using the `visualize_tests` tool:

```
python tools/visualize_tests.py
```

Image test failures can also be analysed using the `triage_tests` tool:

```
python tools/triage_tests.py
```

The triage tool allows you to accept or reject test failures and will copy the new image to the folder where the baseline test images are stored. The triage tool requires that *QT* is installed.

### Writing a simple test

Many elements of Matplotlib can be tested using standard tests. For example, here is a test from `matplotlib/tests/test_basic.py`:

```
def test_simple():
    """
    very simple example test
    """
    assert 1 + 1 == 2
```

Pytest determines which functions are tests by searching for files whose names begin with `"test_"` and then within those files for functions beginning with `"test"` or classes beginning with `"Test"`.

Some tests have internal side effects that need to be cleaned up after their execution (such as created figures or modified *rcParams*). The pytest fixture `matplotlib.testing.conftest.mpl_test_settings` will automatically clean these up; there is no need to do anything further.

### Random data in tests

Random data is a very convenient way to generate data for examples, however the randomness is problematic for testing (as the tests must be deterministic!). To work around this set the seed in each test. For numpy's default random number generator use:

```
import numpy as np
rng = np.random.default_rng(19680801)
```

and then use `rng` when generating the random numbers.

The seed is *John Hunter's* birthday.

### Writing an image comparison test

Writing an image-based test is only slightly more difficult than a simple test. The main consideration is that you must specify the "baseline", or expected, images in the *image_comparison* decorator. For example, this test generates a single image and automatically tests it:

```
from matplotlib.testing.decorators import image_comparison
import matplotlib.pyplot as plt

@image_comparison(baseline_images=['line_dashes'], remove_text=True,
                  extensions=['png'], style='mpl20')
def test_line_dashes():
    fig, ax = plt.subplots()
    ax.plot(range(10), linestyle=(0, (3, 3)), lw=5)
```

The first time this test is run, there will be no baseline image to compare against, so the test will fail. Copy the output images (in this case `result_images/test_lines/test_line_dashes.png`) to the

correct subdirectory of `baseline_images` tree in the source directory (in this case `lib/matplotlib/tests/baseline_images/test_lines`). Put this new file under source code revision control (with `git add`). When rerunning the tests, they should now pass.

It is preferred that new tests use `style='mpl20'` as this leads to smaller figures and reflects the newer look of default Matplotlib plots. Also, if the texts (labels, tick labels, etc) are not really part of what is tested, use `remove_text=True` as this will lead to smaller figures and reduce possible issues with font mismatch on different platforms.

### Compare two methods of creating an image

Baseline images take a lot of space in the Matplotlib repository. An alternative approach for image comparison tests is to use the *check_figures_equal* decorator, which should be used to decorate a function taking two *Figure* parameters and draws the same images on the figures using two different methods (the tested method and the baseline method). The decorator will arrange for setting up the figures and then collect the drawn results and compare them.

For example, this test compares two different methods to draw the same circle: plotting a circle using a *matplotlib.patches.Circle* patch vs plotting the circle using the parametric equation of a circle

```
from matplotlib.testing.decorators import check_figures_equal
import matplotib.patches as mpatches
import matplotlib.pyplot as plt
import numpy as np

@check_figures_equal(extensions=['png'], tol=100)
def test_parametric_circle_plot(fig_test, fig_ref):
    red_circle_ref = mpatches.Circle((0, 0), 0.2, color='r', clip_on=False)
    fig_ref.add_artist(red_circle_ref)
    theta = np.linspace(0, 2 * np.pi, 150)
    radius = 0.4
    fig_test.plot(radius * np.cos(theta), radius * np.sin(theta), color='r')
```

Both comparison decorators have a tolerance argument `tol` that is used to specify the tolerance for difference in color value between the two images, where 255 is the maximal difference. The test fails if the average pixel difference is greater than this value.

See the documentation of *image_comparison* and *check_figures_equal* for additional information about their use.

### Creating a new module in matplotlib.tests

We try to keep the tests categorized by the primary module they are testing. For example, the tests related to the `mathtext.py` module are in `test_mathtext.py`.

### Using GitHub Actions for CI

GitHub Actions is a hosted CI system "in the cloud".

GitHub Actions is configured to receive notifications of new commits to GitHub repos and to run builds or tests when it sees these new commits. It looks for a YAML files in `.github/workflows` to see how to test the project.

GitHub Actions is already enabled for the main Matplotlib GitHub repository -- for example, see the Tests workflows.

GitHub Actions should be automatically enabled for your personal Matplotlib fork once the YAML workflow files are in it. It generally isn't necessary to look at these workflows, since any pull request submitted against the main Matplotlib repository will be tested. The Tests workflow is skipped in forked repositories but you can trigger a run manually from the GitHub web interface.

You can see the GitHub Actions results at https://github.com/your_GitHub_user_name/matplotlib/actions -- here's an example.

### Using tox

Tox is a tool for running tests against multiple Python environments, including multiple versions of Python (e.g., 3.7, 3.8) and even different Python implementations altogether (e.g., CPython, PyPy, Jython, etc.), as long as all these versions are available on your system's $PATH (consider using your system package manager, e.g. apt-get, yum, or Homebrew, to install them).

tox makes it easy to determine if your working copy introduced any regressions before submitting a pull request. Here's how to use it:

```
$ pip install tox
$ tox
```

You can also run tox on a subset of environments:

```
$ tox -e py38,py39
```

Tox processes everything serially so it can take a long time to test several environments. To speed it up, you might try using a new, parallelized version of tox called `detox`. Give this a try:

```
$ pip install -U -i http://pypi.testrun.org detox
$ detox
```

Tox is configured using a file called `tox.ini`. You may need to edit this file if you want to add new environments to test (e.g., `py33`) or if you want to tweak the dependencies or the way the tests are run. For more info on the `tox.ini` file, see the Tox Configuration Specification.

### Building old versions of Matplotlib

When running a `git bisect` to see which commit introduced a certain bug, you may (rarely) need to build very old versions of Matplotlib. The following constraints need to be taken into account:

- Matplotlib 1.3 (or earlier) requires numpy 1.8 (or earlier).

### Testing released versions of Matplotlib

Running the tests on an installation of a released version (e.g. PyPI package or conda package) also requires additional setup.

---

**Note:** For an end-user, there is usually no need to run the tests on released versions of Matplotlib. Official releases are tested before publishing.

---

### Install additional dependencies

Install the *additional dependencies for testing*.

### Obtain the reference images

Many tests compare the plot result against reference images. The reference images are not part of the regular packaged versions (pip wheels or conda packages). If you want to run tests with reference images, you need to obtain the reference images matching the version of Matplotlib you want to test.

To do so, either download the matching source distribution `matplotlib-X.Y.Z.tar.gz` from PyPI or alternatively, clone the git repository and `git checkout vX.Y.Z`. Copy the folder `lib/matplotlib/tests/baseline_images` to the folder `matplotlib/tests` of your the matplotlib installation to test. The correct target folder can be found using:

```
python -c "import matplotlib.tests; print(matplotlib.tests.__file__.rsplit('/
↪', 1)[0])"
```

An analogous copying of `lib/mpl_toolkits/*/tests/baseline_images` is necessary for testing `mpl_toolkits`.

#### Run the tests

To run all the tests on your installed version of Matplotlib:

```
pytest --pyargs matplotlib.tests
```

The test discovery scope can be narrowed to single test modules or even single functions:

```
pytest --pyargs matplotlib.tests.test_simplification.py::test_clipping
```

**Documentation**

### 10.3.4 Write documentation

#### Getting started

#### General file structure

All documentation is built from the `doc/`. The `doc/` directory contains configuration files for Sphinx and reStructuredText (ReST; `.rst`) files that are rendered to documentation pages.

Documentation is created in three ways. First, API documentation (`doc/api`) is created by Sphinx from the docstrings of the classes in the Matplotlib library. Except for `doc/api/api_changes/`, `.rst` files in `doc/api` are created when the documentation is built. See *Write docstrings* below.

Second, our example pages, tutorials, and some of the narrative documentation are created by Sphinx Gallery. Sphinx Gallery converts example Python files to `*.rst` files with the result of Matplotlib plot calls as embedded images. See *Write examples and tutorials* below.

Third, Matplotlib has narrative docs written in ReST in subdirectories of `doc/users/`. If you would like to add new documentation that is suited to an `.rst` file rather than a gallery or tutorial example, choose an appropriate subdirectory to put it in, and add the file to the table of contents of `index.rst` of the subdirectory. See *Write ReST pages* below.

---

**Note:** Don't directly edit the `.rst` files in `doc/plot_types`, `doc/gallery`, `doc/tutorials`, and `doc/api` (excepting `doc/api/api_changes/`). Sphinx regenerates files in these directories when building documentation.

---

### Set up the build

The documentation for Matplotlib is generated from reStructuredText (ReST) using the Sphinx documentation generation tool.

To build the documentation you will need to *set up Matplotlib for development*. Note in particular the *additional dependencies* required to build the documentation.

### Build the docs

The documentation sources are found in the `doc/` directory. The configuration file for Sphinx is `doc/conf.py`. It controls which directories Sphinx parses, how the docs are built, and how the extensions are used. To build the documentation in html format, cd into `doc/` and run:

```
make html
```

**Note:** Since the documentation is very large, the first build may take 10-20 minutes, depending on your machine. Subsequent builds will be faster.

Other useful invocations include

```
# Build the html documentation, but skip generation of the gallery images to
# save time.
make html-noplot

# Build the html documentation, but skip specific subdirectories.  If a␣
↪gallery
# directory is skipped, the gallery images are not generated.  The first
# time this is run, it creates ``.mpl_skip_subdirs.yaml`` which can be edited
# to add or remove subdirectories
make html-skip-subdirs

# Delete built files.  May help if you get errors about missing paths or
# broken links.
make clean

# Build pdf docs.
make latexpdf
```

The `SPHINXOPTS` variable is set to `-W --keep-going` by default to build the complete docs but exit with exit status 1 if there are warnings. To unset it, use

```
make SPHINXOPTS= html
```

You can use the `O` variable to set additional options:

- `make O=-j4 html` runs a parallel build with 4 processes.
- `make O=-Dplot_formats=png:100 html` saves figures in low resolution.

Multiple options can be combined, e.g. `make O='-j4 -Dplot_formats=png:100' html`.

On Windows, set the options as environment variables, e.g.:

```
set SPHINXOPTS= & set O=-j4 -Dplot_formats=png:100 & make html
```

### Show locally built docs

The built docs are available in the folder `build/html`. A shortcut for opening them in your default browser is:

```
make show
```

### Write ReST pages

Most documentation is either in the docstrings of individual classes and methods, in explicit `.rst` files, or in examples and tutorials. All of these use the ReST syntax and are processed by Sphinx.

The Sphinx reStructuredText Primer is a good introduction into using ReST. More complete information is available in the reStructuredText reference documentation.

This section contains additional information and conventions how ReST is used in the Matplotlib documentation.

### Formatting and style conventions

It is useful to strive for consistency in the Matplotlib documentation. Here are some formatting and style conventions that are used.

### Section formatting

Use sentence case `Upper lower` for section titles, e.g., `Possible hangups` rather than `Possible Hangups`.

We aim to follow the recommendations from the Python documentation and the Sphinx reStructuredText documentation for section markup characters, i.e.:

- `#` with overline, for parts. This is reserved for the main title in `index.rst`. All other pages should start with "chapter" or lower.
- `*` with overline, for chapters
- =, for sections
- −, for subsections
- `^`, for subsubsections
- `"`, for paragraphs

This may not yet be applied consistently in existing docs.

### Table formatting

Given the size of the table and length of each entry, use:

| | small table | large table |
|---|---|---|
| short entry | simple or grid table | grid table |
| long entry | list table | csv table |

For more information, see rst tables.

### Function arguments

Function arguments and keywords within docstrings should be referred to using the `*emphasis*` role. This will keep Matplotlib's documentation consistent with Python's documentation:

```
Here is a description of *argument*
```

Do not use the `` `default role` ``:

```
Do not describe `argument` like this.  As per the next section,
this syntax will (unsuccessfully) attempt to resolve the argument as a
link to a class or method in the library.
```

nor the ``` ``literal`` ``` role:

```
Do not describe ``argument`` like this.
```

### Refer to other documents and sections

Sphinx supports internal references:

| Role | Links target | Representation in rendered HTML |
|---|---|---|
| `:doc:` | document | link to a page |
| `:ref:` | reference label | link to an anchor associated with a heading |

Examples:

```
See the :doc:`/install/index`

See the tutorial :ref:`quick_start`

See the example :doc:`/gallery/lines_bars_and_markers/simple_plot`
```

will render as:

> See the *Installation*
>
> See the tutorial *Quick start guide*
>
> See the example *Simple Plot*

Sections can also be given reference labels. For instance from the *Installation* link:

```
.. _clean-install:

How to completely remove Matplotlib
===================================

Occasionally, problems with Matplotlib can be solved with a clean...
```

and refer to it using the standard reference syntax:

```
See :ref:`clean-install`
```

will give the following link: *How to completely remove Matplotlib*

To maximize internal consistency in section labeling and references, use hyphen separated, descriptive labels for section references. Keep in mind that contents may be reorganized later, so avoid top level names in references like `user` or `devel` or `faq` unless necessary, because for example the FAQ "what is a backend?" could later become part of the users guide, so the label:

```
.. _what-is-a-backend:
```

is better than:

```
.. _faq-backend:
```

In addition, since underscores are widely used by Sphinx itself, use hyphens to separate words.

### Refer to other code

To link to other methods, classes, or modules in Matplotlib you can use back ticks, for example:

```
`matplotlib.collections.LineCollection`
```

generates a link like this: *matplotlib.collections.LineCollection*.

*Note:* We use the sphinx setting `default_role = 'obj'` so that you don't have to use qualifiers like `:class:`, `:func:`, `:meth:` and the likes.

Often, you don't want to show the full package and module name. As long as the target is unambiguous you can simply leave them out:

```
`.LineCollection`
```

and the link still works: *LineCollection*. Note that you should typically include the leading dot. It tells Sphinx to look for the given name in the whole project. See also the explanation at Sphinx: Cross-referencing Python objects.

If there are multiple code elements with the same name (e.g. `plot()` is a method in multiple classes), you'll have to extend the definition:

```
`.pyplot.plot` or `.Axes.plot`
```

These will show up as *pyplot.plot* or *Axes.plot*. To still show only the last segment you can add a tilde as prefix:

```
`~.pyplot.plot` or `~.Axes.plot`
```

will render as *plot* or *plot*.

Other packages can also be linked via intersphinx:

```
`numpy.mean`
```

will return this link: `numpy.mean`. This works for Python, Numpy, Scipy, and Pandas (full list is in `doc/conf.py`). If external linking fails, you can check the full list of referenceable objects with the following commands:

```
python -m sphinx.ext.intersphinx 'https://docs.python.org/3/objects.inv'
python -m sphinx.ext.intersphinx 'https://numpy.org/doc/stable/objects.inv'
python -m sphinx.ext.intersphinx 'https://docs.scipy.org/doc/scipy/objects.inv
↪'
python -m sphinx.ext.intersphinx 'https://pandas.pydata.org/pandas-docs/
↪stable/objects.inv'
```

### Include figures and files

Image files can directly included in pages with the `image::` directive. e.g., `tutorials/intermediate/constrainedlayout_guide.py` displays a couple of static images:

```
# .. image:: /_static/constrained_layout_1b.png
#    :align: center
```

Files can be included verbatim. For instance the `LICENSE` file is included at *License agreement* using

```
.. literalinclude:: ../../LICENSE/LICENSE
```

The examples directory is copied to `doc/gallery` by sphinx-gallery, so plots from the examples directory can be included using

```
.. plot:: gallery/lines_bars_and_markers/simple_plot.py
```

Note that the python script that generates the plot is referred to, rather than any plot that is created. Sphinx-gallery will provide the correct reference when the documentation is built.

### Tools for writing mathematical expressions

In most cases, you will likely want to use one of Sphinx's builtin Math extensions. In rare cases we want the rendering of the mathematical text in the documentation html to exactly match with the rendering of the mathematical expression in the Matplotlib figure. In these cases, you can use the `matplotlib.sphinxext.mathmpl` Sphinx extension (See also the *Writing mathematical expressions* tutorial.)

### Write docstrings

Most of the API documentation is written in docstrings. These are comment blocks in source code that explain how the code works.

---

**Note:** Some parts of the documentation do not yet conform to the current documentation style. If in doubt, follow the rules given here and not what you may see in the source code. Pull requests updating docstrings to the current style are very welcome.

---

All new or edited docstrings should conform to the numpydoc docstring guide. Much of the ReST syntax discussed above (*Write ReST pages*) can be used for links and references. These docstrings eventually populate the `doc/api` directory and form the reference documentation for the library.

### Example docstring

An example docstring looks like:

```
def hlines(self, y, xmin, xmax, colors=None, linestyles='solid',
           label='', **kwargs):
    """
    Plot horizontal lines at each *y* from *xmin* to *xmax*.

    Parameters
    ----------
    y : float or array-like
        y-indexes where to plot the lines.

    xmin, xmax : float or array-like
        Respective beginning and end of each line. If scalars are
        provided, all lines will have the same length.

    colors : list of colors, default: :rc:`lines.color`

    linestyles : {'solid', 'dashed', 'dashdot', 'dotted'}, optional

    label : str, default: ''

    Returns
    -------
    `~matplotlib.collections.LineCollection`
```

(continues on next page)

(continued from previous page)

```
    Other Parameters
    ----------------
    data : indexable object, optional
        DATA_PARAMETER_PLACEHOLDER
    **kwargs :  `~matplotlib.collections.LineCollection` properties.

    See Also
    --------
    vlines : vertical lines
    axhline : horizontal line across the Axes
    """
```

See the *hlines* documentation for how this renders.

The Sphinx website also contains plenty of documentation concerning ReST markup and working with Sphinx in general.

### Formatting conventions

The basic docstring conventions are covered in the numpydoc docstring guide and the Sphinx documentation. Some Matplotlib-specific formatting conventions to keep in mind:

### Quote positions

The quotes for single line docstrings are on the same line (pydocstyle D200):

```
def get_linewidth(self):
    """Return the line width in points."""
```

The quotes for multi-line docstrings are on separate lines (pydocstyle D213):

```
def set_linestyle(self, ls):
"""
Set the linestyle of the line.

[...]
"""
```

### Function arguments

Function arguments and keywords within docstrings should be referred to using the `*emphasis*` role. This will keep Matplotlib's documentation consistent with Python's documentation:

```
If *linestyles* is *None*, the default is 'solid'.
```

Do not use the `` `default role` `` or the ``` ``literal`` ``` role:

```
Neither `argument` nor ``argument`` should be used.
```

### Quotes for strings

Matplotlib does not have a convention whether to use single-quotes or double-quotes. There is a mixture of both in the current code.

Use simple single or double quotes when giving string values, e.g.

```
If 'tight', try to figure out the tight bbox of the figure.

No ``'extra'`` literal quotes.
```

The use of extra literal quotes around the text is discouraged. While they slightly improve the rendered docs, they are cumbersome to type and difficult to read in plain-text docs.

### Parameter type descriptions

The main goal for parameter type descriptions is to be readable and understandable by humans. If the possible types are too complex use a simplification for the type description and explain the type more precisely in the text.

Generally, the numpydoc docstring guide conventions apply. The following rules expand on them where the numpydoc conventions are not specific.

Use `float` for a type that can be any number.

Use `(float, float)` to describe a 2D position. The parentheses should be included to make the tupleness more obvious.

Use `array-like` for homogeneous numeric sequences, which could typically be a numpy.array. Dimensionality may be specified using `2D`, `3D`, `n-dimensional`. If you need to have variables denoting the sizes of the dimensions, use capital letters in brackets (`(M, N) array-like`). When referring to them in the text they are easier read and no special formatting is needed. Use `array` instead of `array-like` for return types if the returned object is indeed a numpy array.

`float` is the implicit default dtype for array-likes. For other dtypes use `array-like of int`.

Some possible uses:

```
2D array-like
(N,) array-like
(M, N) array-like
(M, N, 3) array-like
array-like of int
```

Non-numeric homogeneous sequences are described as lists, e.g.:

```
list of str
list of `.Artist`
```

### Reference types

Generally, the rules from *referring-to-other-code* apply. More specifically:

Use full references `~matplotlib.colors.Normalize` with an abbreviation tilde in parameter types. While the full name helps the reader of plain text docstrings, the HTML does not need to show the full name as it links to it. Hence, the ~-shortening keeps it more readable.

Use abbreviated links `.Normalize` in the text.

```
norm : `~matplotlib.colors.Normalize`, optional
    A `.Normalize` instance is used to scale luminance data to 0, 1.
```

### Default values

As opposed to the numpydoc guide, parameters need not be marked as *optional* if they have a simple default:

- use `{name} : {type}, default: {val}` when possible.
- use `{name} : {type}, optional` and describe the default in the text if it cannot be explained sufficiently in the recommended manner.

The default value should provide semantic information targeted at a human reader. In simple cases, it restates the value in the function signature. If applicable, units should be added.

```
Prefer:
    interval : int, default: 1000ms
over:
    interval : int, default: 1000
```

If *None* is only used as a sentinel value for "parameter not specified", do not document it as the default. Depending on the context, give the actual default, or mark the parameter as optional if not specifying has no particular effect.

```
Prefer:
    dpi : float, default: :rc:`figure.dpi`
over:
    dpi : float, default: None
```

(continues on next page)

(continued from previous page)

```
Prefer:
    textprops : dict, optional
        Dictionary of keyword parameters to be passed to the
        `~matplotlib.text.Text` instance contained inside TextArea.
over:
    textprops : dict, default: None
        Dictionary of keyword parameters to be passed to the
        `~matplotlib.text.Text` instance contained inside TextArea.
```

### `See also` sections

Sphinx automatically links code elements in the definition blocks of `See also` sections. No need to use backticks there:

```
See Also
--------
vlines : vertical lines
axhline : horizontal line across the Axes
```

### Wrap parameter lists

Long parameter lists should be wrapped using a \ for continuation and starting on the new line without any indent (no indent because pydoc will parse the docstring and strip the line continuation so that indent would result in a lot of whitespace within the line):

```
def add_axes(self, *args, **kwargs):
    """
    ...

    Parameters
    ----------
    projection : {'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', \
'rectilinear'}, optional
        The projection type of the axes.

    ...
    """
```

Alternatively, you can describe the valid parameter values in a dedicated section of the docstring.

### rcParams

rcParams can be referenced with the custom `:rc:` role: `:rc:`foo`` yields `rcParams["foo"] = 'default'`, which is a link to the `matplotlibrc` file description.

### Setters and getters

Artist properties are implemented using setter and getter methods (because Matplotlib predates the Python `property` decorator). By convention, these setters and getters are named `set_PROPERTYNAME` and `get_PROPERTYNAME`; the list of properties thusly defined on an artist and their values can be listed by the *setp* and *getp* functions.

The Parameters block of property setter methods is parsed to document the accepted values, e.g. the docstring of *Line2D.set_linestyle* starts with

```
def set_linestyle(self, ls):
    """
    Set the linestyle of the line.

    Parameters
    ----------
    ls : {'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
        etc.
    """
```

which results in the following line in the output of `plt.setp(line)` or `plt.setp(line, "linestyle")`:

```
linestyle or ls: {'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
```

In some rare cases (mostly, setters which accept both a single tuple and an unpacked tuple), the accepted values cannot be documented in such a fashion; in that case, they can be documented as an `.. ACCEPTS:` block, e.g. for *axes.Axes.set_xlim*:

```
def set_xlim(self, left=None, right=None):
    """
    Set the x-axis view limits.

    Parameters
    ----------
    left : float, optional
        The left xlim in data coordinates. Passing *None* leaves the
        limit unchanged.

        The left and right xlims may also be passed as the tuple
        (*left*, *right*) as the first positional argument (or as
        the *left* keyword argument).

        .. ACCEPTS: (bottom: float, top: float)
```

(continues on next page)

(continued from previous page)

```
    right : float, optional
        etc.
    """
```

Note that the leading `..` makes the `.. ACCEPTS:` block a reST comment, hiding it from the rendered docs.

### Keyword arguments

**Note:** The information in this section is being actively discussed by the development team, so use the docstring interpolation only if necessary. This section has been left in place for now because this interpolation is part of the existing documentation.

Since Matplotlib uses a lot of pass-through `kwargs`, e.g., in every function that creates a line (*plot*, *semilogx*, *semilogy*, etc.), it can be difficult for the new user to know which `kwargs` are supported. Matplotlib uses a docstring interpolation scheme to support documentation of every function that takes a `**kwargs`. The requirements are:

1. single point of configuration so changes to the properties don't require multiple docstring edits.
2. as automated as possible so that as properties change, the docs are updated automatically.

The `@_docstring.interpd` decorator implements this. Any function accepting *Line2D* pass-through `kwargs`, e.g., *matplotlib.axes.Axes.plot*, can list a summary of the *Line2D* properties, as follows:

```
# in axes.py
@_docstring.interpd
def plot(self, *args, **kwargs):
    """
    Some stuff omitted

    Other Parameters
    ----------------
    scalex, scaley : bool, default: True
        These parameters determine if the view limits are adapted to the
        data limits. The values are passed on to `autoscale_view`.

    **kwargs : `.Line2D` properties, optional
        *kwargs* are used to specify properties like a line label (for
        auto legends), linewidth, antialiasing, marker face color.
        Example::

        >>> plot([1, 2, 3], [1, 2, 3], 'go-', label='line 1', linewidth=2)
        >>> plot([1, 2, 3], [1, 4, 9], 'rs', label='line 2')

        If you specify multiple lines with one plot call, the kwargs apply
        to all those lines. In case the label object is iterable, each
        element is used as labels for each set of data.
```

(continues on next page)

(continued from previous page)

```
        Here is a list of available `.Line2D` properties:

        %(Line2D:kwdoc)s
    """
```

The `%(Line2D:kwdoc)` syntax makes `interpd` lookup an *Artist* subclass named `Line2D`, and call *artist.kwdoc* on that class. *artist.kwdoc* introspects the subclass and summarizes its properties as a substring, which gets interpolated into the docstring.

Note that this scheme does not work for decorating an Artist's `__init__`, as the subclass and its properties are not defined yet at that point. Instead, `@_docstring.interpd` can be used to decorate the class itself -- at that point, *kwdoc* can list the properties and interpolate them into `__init__.__doc__`.

### Inherit docstrings

If a subclass overrides a method but does not change the semantics, we can reuse the parent docstring for the method of the child class. Python does this automatically, if the subclass method does not have a docstring.

Use a plain comment `# docstring inherited` to denote the intention to reuse the parent docstring. That way we do not accidentally create a docstring in the future:

```
class A:
    def foo():
        """The parent docstring."""
        pass

class B(A):
    def foo():
        # docstring inherited
        pass
```

### Add figures

As above (see *Include figures and files*), figures in the examples gallery can be referenced with a `.. plot::` directive pointing to the python script that created the figure. For instance the *legend* docstring references the file `examples/text_labels_and_annotations/legend.py`:

```
"""
...

Examples
--------

.. plot:: gallery/text_labels_and_annotations/legend.py
"""
```

Note that `examples/text_labels_and_annotations/legend.py` has been mapped to `gallery/text_labels_and_annotations/legend.py`, a redirection that may be fixed in future re-organization of the docs.

Plots can also be directly placed inside docstrings. Details are in *matplotlib.sphinxext.plot_directive*. A short example is:

```
"""
...

Examples
--------

.. plot::
   import matplotlib.image as mpimg
   img = mpimg.imread('_static/stinkbug.png')
   imgplot = plt.imshow(img)
"""
```

An advantage of this style over referencing an example script is that the code will also appear in interactive docstrings.

### Write examples and tutorials

Examples and tutorials are Python scripts that are run by Sphinx Gallery. Sphinx Gallery finds `*.py` files in source directories and runs the files to create images and narrative that are embedded in `*.rst` files in a build location of the `doc/` directory. Files in the build location should not be directly edited as they will be overwritten by Sphinx gallery. Currently Matplotlib has four galleries as follows:

| Source location | Build location |
|---|---|
| `galleries/plot_types` | `doc/plot_types` |
| `galleries/examples` | `doc/gallery` |
| `galleries/tutorials` | `doc/tutorials` |
| `galleries/users_explain` | `doc/users/explain` |

The first three are traditional galleries. The last, `galleries/users_explain`, is a mixed gallery where some of the files are raw `*.rst` files and some are `*.py` files; Sphinx Gallery just copies these `*.rst` files from the source location to the build location (see *Raw restructured text files in the gallery*, below).

In the Python files, to exclude an example from having a plot generated, insert "sgskip" somewhere in the filename.

### Format examples

The format of these files is relatively straightforward. Properly formatted comment blocks are treated as ReST text, the code is displayed, and figures are put into the built page. Matplotlib uses the `# %%` section separator so that IDEs will identify "code cells" to make it easy to re-run sub-sections of the example.

For instance the example *Simple Plot* example is generated from `/galleries/examples/lines_bars_and_markers/simple_plot.py`, which looks like:

```
"""
===========
Simple Plot
===========

Create a simple plot.
"""
import matplotlib.pyplot as plt
import numpy as np

# Data for plotting
t = np.arange(0.0, 2.0, 0.01)
s = 1 + np.sin(2 * np.pi * t)

# Note that using plt.subplots below is equivalent to using
# fig = plt.figure and then ax = fig.add_subplot(111)
fig, ax = plt.subplots()
ax.plot(t, s)

ax.set(xlabel='time (s)', ylabel='voltage (mV)',
       title='About as simple as it gets, folks')
ax.grid()
plt.show()
```

The first comment block is treated as ReST text. The other comment blocks render as comments in *Simple Plot*.

Tutorials are made with the exact same mechanism, except they are longer, and typically have more than one comment block (i.e. *Quick start guide*). The first comment block can be the same as the example above. Subsequent blocks of ReST text are delimited by the line `# %%` :

```
"""
===========
Simple Plot
===========

Create a simple plot.
"""
...
ax.grid()
plt.show()

# %%
```

(continues on next page)

(continued from previous page)

```
# Second plot
# ===========
#
# This is a second plot that is very nice

fig, ax = plt.subplots()
ax.plot(np.sin(range(50)))
```

In this way text, code, and figures are output in a "notebook" style.

### Sample data

When sample data comes from a public dataset, please cite the source of the data. Sample data should be written out in the code. When this is not feasible, the data can be loaded using *cbook.get_sample_data*.

```
import matplotlib.cbook as cbook
fh = cbook.get_sample_data('mydata.dat')
```

If the data is too large to be included in the code, it should be added to `lib/matplotlib/mpl-data/sample_data/`

### Create mini-gallery

The showcased Matplotlib functions should be listed in an admonition at the bottom as follows

```
# %%
#
# .. admonition:: References
#
#    The use of the following functions, methods, classes and modules is shown
#    in this example:
#
#    - `matplotlib.axes.Axes.fill` / `matplotlib.pyplot.fill`
#    - `matplotlib.axes.Axes.axis` / `matplotlib.pyplot.axis`
```

This allows sphinx-gallery to place an entry to the example in the mini-gallery of the mentioned functions. Whether or not a function is mentioned here should be decided depending on if a mini-gallery link prominently helps to illustrate that function; e.g. mention `matplotlib.pyplot.subplots` only in examples that are about laying out subplots, not in every example that uses it.

Functions that exist in `pyplot` as well as in Axes or Figure should mention both references no matter which one is used in the example code. The `pyplot` reference should always be the second to mention; see the example above.

### Order examples

The order of the sections of the *Tutorials* and the *Examples*, as well as the order of the examples within each section are determined in a two step process from within the `/doc/sphinxext/gallery_order.py`:

- *Explicit order*: This file contains a list of folders for the section order and a list of examples for the subsection order. The order of the items shown in the doc pages is the order those items appear in those lists.
- *Implicit order*: If a folder or example is not in those lists, it will be appended after the explicitly ordered items and all of those additional items will be ordered by pathname (for the sections) or by filename (for the subsections).

As a consequence, if you want to let your example appear in a certain position in the gallery, extend those lists with your example. In case no explicit order is desired or necessary, still make sure to name your example consistently, i.e. use the main function or subject of the example as first word in the filename; e.g. an image example should ideally be named similar to `imshow_mynewexample.py`.

### Raw restructured text files in the gallery

Sphinx Gallery folders usually consist of a `README.txt` and a series of Python source files that are then translated to an `index.rst` file and a series of `example_name.rst` files in the `doc/` subdirectories. However, Sphinx Gallery also allows raw `*.rst` files to be passed through a gallery (see Manually passing files in the Sphinx Gallery documentation). We use this feature in `galleries/users_explain`, where, for instance, `galleries/users_explain/colors` is a regular Sphinx Gallery subdirectory, but `galleries/users_explain/artists` has a mix of `*.rst` and `*py` files. For mixed subdirectories like this, we must add any `*.rst` files to a `:toctree:`, either in the `README.txt` or in a manual `index.rst`.

### Miscellaneous

### Move documentation

Sometimes it is desirable to move or consolidate documentation. With no action this will lead to links either going dead (404) or pointing to old versions of the documentation. Preferable is to replace the old page with an html refresh that immediately redirects the viewer to the new page. So, for example we move `/doc/topic/old_info.rst` to `/doc/topic/new_info.rst`. We remove `/doc/topic/old_info.rst` and in `/doc/topic/new_info.rst` we insert a `redirect-from` directive that tells sphinx to still make the old file with the html refresh/redirect in it (probably near the top of the file to make it noticeable)

```
.. redirect-from:: /topic/old_info
```

In the built docs this will yield an html file `/build/html/topic/old_info.html` that has a refresh to `new_info.html`. If the two files are in different subdirectories:

```
.. redirect-from:: /old_topic/old_info2
```

will yield an html file `/build/html/old_topic/old_info2.html` that has a (relative) refresh to `../topic/new_info.html`.

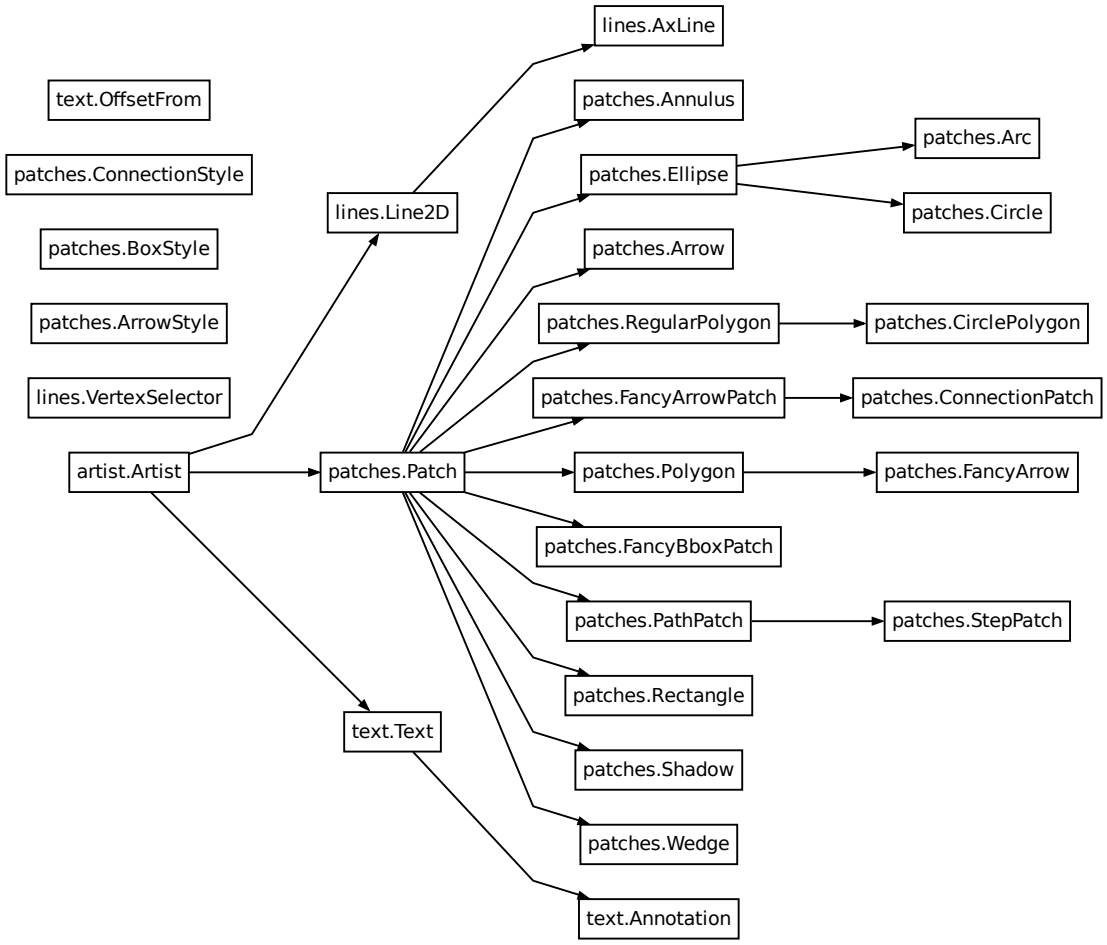
Use the full path for this directive, relative to the doc root at `https://matplotlib.org/stable/`. So `/old_topic/old_info2` would be found by users at `http://matplotlib.org/stable/old_topic/old_info2`. For clarity, do not use relative links.

### Generate inheritance diagrams

Class inheritance diagrams can be generated with the Sphinx inheritance-diagram directive.

Example:

```
.. inheritance-diagram:: matplotlib.patches matplotlib.lines matplotlib.text
   :parts: 2
```



#### Navbar and style

Matplotlib has a few subprojects that share the same navbar and style, so these are centralized as a sphinx theme at mpl_sphinx_theme. Changes to the style or topbar should be made there to propagate across all subprojects.

### 10.3.5 Documentation style guide

This guide contains best practices for the language and formatting of Matplotlib documentation.

**See also:**

For more information about contributing, see the *Write documentation* section.

#### Expository language

For explanatory writing, the following guidelines are for clear and concise language use.

#### Terminology

There are several key terms in Matplotlib that are standards for reliability and consistency in documentation. They are not interchangeable.

| Term | Description | Correct | Incorrect |
|---|---|---|---|
| `Figure` | Matplotlib working space for programming. | • *For Matplotlib objects*: Figure, "The Figure is the working space for the visual.<br>• *Referring to class*: `Figure`, "Methods within the `Figure` provide the visuals."<br>• *General language*: figure, "Michelle Kwan is a famous figure skater." | • "The figure is the working space for visuals."<br>• "Methods in the figure provide the visuals."<br>• "The `Figure` Four leglock is a wrestling move." |
| `Axes` | Subplots within Figure. Contains plot elements and is responsible for plotting and configuring additional details. | • *For Matplotlib objects*: Axes, "An Axes is a subplot within the Figure."<br>• *Referring to class*: `Axes`, "Each `Axes` is specific to one Figure."<br>• *General language*: axes, "Both loggers and lumberjacks use axes to chop wood." OR "There are no standard names for the coordinates in the three axes." (Plural of axis) | • "The axes methods transform the data."<br>• "Each `Axes` is specific to a Figure."<br>• "The musicians on stage call their guitars Axes."<br>• "The point where the Axes meet is the origin of the coordinate system." |
| `Artist` | Broad variety of Matplotlib objects that display visuals. | • *For Matplotlib objects*: Artist, "Artists display visuals and are the visible elements when rendering a Figure."<br>• *Referring to class*: `Artist`, "Each `Artist` has respective methods and functions."<br>• *General language*: artist, "The artist in the museum is from France." | • "Configure the legend artist with its respective method."<br>• "There is an `Artist` for that visual in the graph."<br>• "Some Artists became famous only by accident." |
| `Axis` | Human-readable single dimensional object of reference marks containing ticks, tick labels, spines, and edges. | • *For Matplotlib objects*: Axis, "The Axis for the bar chart is a separate Artist." (plural, Axis objects)<br>• *Referring to class*: `Axis`, "The `Axis` contains respective XAxis and YAxis objects."<br>• *General language*: axis, "Rotation around a fixed axis is a special case of rotational motion." | • "Plot the graph onto the axis."<br>• "Each Axis is usually named after the coordinate which is measured along it."<br>• "In some computer graphics contexts, the ordinate `Axis` may be oriented downwards." |

### Grammar

#### Subject

Use second-person imperative sentences for directed instructions specifying an action. Second-person pronouns are for individual-specific contexts and possessive reference.

| Correct | Incorrect |
|---|---|
| Install Matplotlib from the source directory using the Python `pip` installer program. Depending on your operating system, you may need additional support. | You can install Matplotlib from the source directory. You can find additional support if you are having trouble with your installation. |

#### Tense

Use present simple tense for explanations. Avoid future tense and other modal or auxiliary verbs when possible.

| Correct | Incorrect |
|---|---|
| The fundamental ideas behind Matplotlib for visualization involve taking data and transforming it through functions and methods. | Matplotlib will take data and transform it through functions and methods. They can generate many kinds of visuals. These will be the fundamentals for using Matplotlib. |

#### Voice

Write in active sentences. Passive voice is best for situations or conditions related to warning prompts.

| Correct | Incorrect |
|---|---|
| The function `plot` generates the graph. | The graph is generated by the `plot` function. |
| An error message is returned by the function if there are no arguments. | You will see an error message from the function if there are no arguments. |

### Sentence structure

Write with short sentences using Subject-Verb-Object order regularly. Limit coordinating conjunctions in sentences. Avoid pronoun references and subordinating conjunctive phrases.

| Correct | Incorrect |
|---|---|
| The `pyplot` module in Matplotlib is a collection of functions. These functions create, manage, and manipulate the current Figure and plotting area. | The `pyplot` module in Matplotlib is a collection of functions which create, manage, and manipulate the current Figure and plotting area. |
| The `plot` function plots data to the respective Axes. The Axes corresponds to the respective Figure. | The `plot` function plots data within its respective Axes for its respective Figure. |
| The implicit approach is a convenient shortcut for generating simple plots. | Users that wish to have convenient shortcuts for generating plots use the implicit approach. |

### Formatting

The following guidelines specify how to incorporate code and use appropriate formatting for Matplotlib documentation.

### Code

Matplotlib is a Python library and follows the same standards for documentation.

### Comments

Examples of Python code have comments before or on the same line.

| Correct | Incorrect |
|---|---|
| `# Data`<br>`years = [2006, 2007, 2008]` | `years = [2006, 2007, 2008]`<br>`# Data` |
| `years = [2006, 2007, 2008]  # Data` | |

### Outputs

When generating visuals with Matplotlib using `.py` files in examples, display the visual with *`matplotlib.pyplot.show`* to display the visual. Keep the documentation clear of Python output lines.

| Correct | Incorrect |
| --- | --- |
| `plt.plot([1, 2, 3], [1, 2, 3])`<br>`plt.show()` | `plt.plot([1, 2, 3], [1, 2, 3])` |
| `fig, ax = plt.subplots()`<br>`ax.plot([1, 2, 3], [1, 2, 3])`<br>`fig.show()` | `fig, ax = plt.subplots()`<br>`ax.plot([1, 2, 3], [1, 2, 3])` |

### reStructuredText

Matplotlib uses reStructuredText Markup for documentation. Sphinx helps to transform these documents into appropriate formats for accessibility and visibility.

- reStructuredText Specifications
- Quick Reference Document

### Lists

Bulleted lists are for items that do not require sequencing. Numbered lists are exclusively for performing actions in a determined order.

| Correct | Incorrect |
| --- | --- |
| The example uses three graphs. | The example uses three graphs. |
| • Bar<br>• Line<br>• Pie | 1. Bar<br>2. Line<br>3. Pie |
| These four steps help to get started using Matplotlib. | The following steps are important to get started using Matplotlib. |
| 1. Import the Matplotlib library.<br>2. Import the necessary modules.<br>3. Set and assign data to work on.<br>4. Transform data with methods and functions. | • Import the Matplotlib library.<br>• Import the necessary modules.<br>• Set and assign data to work on.<br>• Transform data with methods and functions. |

### Tables

Use ASCII tables with reStructuredText standards in organizing content. Markdown tables and the csv-table directive are not accepted.

| Correct | Incorrect |
|---|---|

| Correct | Incorrect |
|---|---|
| OK | Not OK |

```
| Correct | Incorrect |
| ------- | --------- |
| OK      | Not OK    |
```

```
+----------+----------+
| Correct  | Incorrect|
+==========+==========+
| OK       | Not OK   |
+----------+----------+
```

```
.. csv-table::
   :header: "correct", "incorrect"
   :widths: 10, 10

   "OK   ", "Not OK"
```

```
==========  ==========
  Correct     Incorrect
==========  ==========
OK          Not OK
==========  ==========
```

### Additional resources

This style guide is not a comprehensive standard. For a more thorough reference of how to contribute to documentation, see the links below. These resources contain common best practices for writing documentation.

- Python Developer's Guide
- Google Developer Style Guide
- IBM Style Guide
- Red Hat Style Guide

### 10.3.6 Guidelines for assigning tags to gallery examples

#### Why do we need tags?

Tags serve multiple purposes.

Tags have a one-to-many organization (i.e. one example can have several tags), while the gallery structure requires that examples are placed in only one location. This means tags provide a secondary layer of organization and make the gallery of examples more flexible and more user-friendly.

They allow for better discoverability, search, and browse functionality. They are helpful for users struggling to write a search query for what they're looking for.

Hidden tags provide additional functionality for maintainers and contributors.

#### What gets a tag?

Every gallery example should be tagged with:

- 1+ content tags
- structural, domain, or internal tag(s) if helpful

Tags can repeat existing forms of organization (e.g. an example is in the Animation folder and also gets an `animation` tag).

Tags are helpful to denote particularly good "byproduct" examples. E.g. the explicit purpose of a gallery example might be to demonstrate a colormap, but it's also a good demonstration of a legend. Tag `legend` to indicate that, rather than changing the title or the scope of the example.

**Tag Categories** - See Tag Glossary for a complete list of tags.

I. API tags: what content from the API reference is in the example?

II. Structural tags: what format is the example? What context can we provide?

III. Domain tags: what discipline(s) might seek this example consistently?

IV. Internal tags: what information is helpful for maintainers or contributors?

#### Proposing new tags

1. Review existing tag list, looking out for similar entries (i.e. `axes` and `axis`).
2. If a relevant tag or subcategory does not yet exist, propose it. Each tag is two parts: `subcategory:tag`. Tags should be one or two words.
3. New tags should be be added when they are relevant to existing gallery entries too. Avoid tags that will link to only a single gallery entry.
4. Tags can recreate other forms of organization.

Note: Tagging organization aims to work for 80-90% of cases. Some examples fall outside of the tagging structure. Niche or specific examples shouldn't be given standalone tags that won't apply to other examples.

#### How to tag?

Put each tag as a directive at the bottom of the page.

#### Related content

#### What is a gallery example?

The gallery of examples contains visual demonstrations of matplotlib features. Gallery examples exist so that users can scan through visual examples.

Unlike tutorials or user guides, gallery examples teach by demonstration, rather than by explanation or instruction.

Gallery examples should avoid instruction or excessive explanation except for brief clarifying code comments. Instead, they can tag related concepts and/or link to relevant tutorials or user guides.

#### Format

All *Examples* should aim to follow the following format:

- Title: 1-6 words, descriptive of content
- Subtitle: 10-50 words, action-oriented description of the example subject
- Image: a clear demonstration of the subject, showing edge cases and different applications if possible
- Code + Text (optional): code, commented as appropriate + written text to add context if necessary

Example:

The `bbox_intersect` gallery example demonstrates the point of visual examples:

- this example is "messy" in that it's hard to categorize, but the gallery is the right spot for it because it makes sense to find it by visual search
- https://matplotlib.org/devdocs/gallery/misc/bbox_intersect.html#sphx-glr-gallery-misc-bbox-intersect-py

**Triage And Review**

### 10.3.7 Bug triaging and issue curation

The issue tracker is important to communication in the project because it serves as the centralized location for making feature requests, reporting bugs, identifying major projects to work on, and discussing priorities. For this reason, it is important to curate the issue list, adding labels to issues and closing issues that are resolved or unresolvable.

Writing well defined issues increases their chances of being successfully resolved. Guidelines on writing a good issue can be found in *here*. The recommendations in this page are adapted from the scikit learn and Pandas contributing guides.

### Improve issue reports

Triaging issues does not require any particular expertise in the internals of Matplotlib, is extremely valuable to the project, and we welcome anyone to participate in issue triage! However, people who are not part of the Matplotlib organization do not have permissions to change milestones, add labels, or close issue.

If you do not have enough GitHub permissions do something (e.g. add a label, close an issue), please leave a comment with your recommendations!

The following actions are typically useful:

- documenting issues that are missing elements to reproduce the problem such as code samples
- suggesting better use of code formatting (e.g. triple back ticks in the markdown).
- suggesting to reformulate the title and description to make them more explicit about the problem to be solved
- linking to related issues or discussions while briefly describing how they are related, for instance "See also #xyz for a similar attempt at this" or "See also #xyz where the same thing was reported" provides context and helps the discussion
- verifying that the issue is reproducible
- classify the issue as a feature request, a long standing bug or a regression

**Fruitful discussions**

Online discussions may be harder than it seems at first glance, in particular given that a person new to open-source may have a very different understanding of the process than a seasoned maintainer.

Overall, it is useful to stay positive and assume good will. The following article explores how to lead online discussions in the context of open source.

### Maintainers and triage team members

In addition to the above, maintainers and the triage team can do the following important tasks:

- Update labels for issues and PRs: see the list of available GitHub labels.
- Triage issues:
  - **reproduce the issue**, if the posted code is a bug label the issue with "status: confirmed bug".
  - **identify regressions**, determine if the reported bug used to work as expected in a recent version of Matplotlib and if so determine the last working version. Regressions should be milestoned for the next bug-fix release and may be labeled as "Release critical".
  - **close usage questions** and politely point the reporter to use discourse or Stack Overflow instead and label as "community support".
  - **close duplicate issues**, after checking that they are indeed duplicate. Ideally, the original submitter moves the discussion to the older, duplicate issue

- **close issues that cannot be replicated**, after leaving time (at least a week) to add extra information

**Closing issues: a tough call**

When uncertain on whether an issue should be closed or not, it is best to strive for consensus with the original poster, and possibly to seek relevant expertise. However, when the issue is a usage question or has been considered as unclear for many years, then it should be closed.

### Preparing PRs for review

Reviewing code is also encouraged. Contributors and users are welcome to participate to the review process following our *review guidelines*.

### Triage workflow

The following workflow is a good way to approach issue triaging:

1. Thank the reporter for opening an issue

   The issue tracker is many people's first interaction with the Matplotlib project itself, beyond just using the library. As such, we want it to be a welcoming, pleasant experience.

2. Is this a usage question? If so close it with a polite message.

3. Is the necessary information provided?

   Check that the poster has filled in the issue template. If crucial information (the version of Python, the version of Matplotlib used, the OS, and the backend), is missing politely ask the original poster to provide the information.

4. Is the issue minimal and reproducible?

   For bug reports, we ask that the reporter provide a minimal reproducible example. See this useful post by Matthew Rocklin for a good explanation. If the example is not reproducible, or if it's clearly not minimal, feel free to ask the reporter if they can provide an example or simplify the provided one. Do acknowledge that writing minimal reproducible examples is hard work. If the reporter is struggling, you can try to write one yourself.

   If a reproducible example is provided, but you see a simplification, add your simpler reproducible example.

   If you cannot reproduce the issue, please report that along with your OS, Python, and Matplotlib versions.

   If we need more information from either this or the previous step please label the issue with "status: needs clarification".

5. Is this a regression?

While we strive for a bug-free library, regressions are the highest priority. If we have broken user-code that *used to* work, we should fix that in the next micro release!

Try to determine when the regression happened by running the reproduction code against older versions of Matplotlib. This can be done by released versions of Matplotlib (to get the version it last worked in) or by using git bisect to find the first commit where it was broken.

6. Is this a duplicate issue?

   We have many open issues. If a new issue seems to be a duplicate, point to the original issue. If it is a clear duplicate, or consensus is that it is redundant, close it. Make sure to still thank the reporter, and encourage them to chime in on the original issue, and perhaps try to fix it.

   If the new issue provides relevant information, such as a better or slightly different example, add it to the original issue as a comment or an edit to the original post.

   Label the closed issue with "status: duplicate"

7. Make sure that the title accurately reflects the issue. If you have the necessary permissions edit it yourself if it's not clear.

8. Add the relevant labels, such as "Documentation" when the issue is about documentation, "Bug" if it is clearly a bug, "New feature" if it is a new feature request, ...

   If the issue is clearly defined and the fix seems relatively straightforward, label the issue as “Good first issue” (and possibly a description of the fix or a hint as to where in the code base to look to get started).

   An additional useful step can be to tag the corresponding module e.g. the "GUI/Qt" label when relevant.

### Triage team

If you would like to join the triage team:

1. Correctly triage 2-3 issues.
2. Ask someone on in the Matplotlib organization (publicly or privately) to recommend you to the triage team (look for "Member" on the top-right of comments on GitHub). If you worked with someone on the issues triaged, they would be a good person to ask.
3. Responsibly exercise your new power!

Anyone with commit or triage rights may nominate a user to be invited to join the triage team by emailing matplotlib-steering-council@numfocus.org .

### 10.3.8 Pull request guidelines

Pull requests (PRs) on GitHub are the mechanism for contributing to Matplotlib's code and documentation.

We value contributions from people with all levels of experience. In particular, if this is your first PR not everything has to be perfect. We'll guide you through the PR process. Nevertheless, please try to follow our guidelines as well as you can to help make the PR process quick and smooth. If your pull request is incomplete or a work-in-progress, please mark it as a draft pull requests on GitHub and specify what feedback from the developers would be helpful.

Please be patient with reviewers. We try our best to respond quickly, but we have limited bandwidth. If there is no feedback within a couple of days, please ping us by posting a comment to your PR or reaching out on a *communication channel*

#### Summary for pull request authors

We recommend that you check that your contribution complies with the following guidelines before submitting a pull request:

- Changes, both new features and bugfixes, should have good test coverage. See *Testing* for more details.
- Update the *documentation* if necessary.
- All public methods should have informative docstrings with sample usage when appropriate. Use the *docstring standards*.
- For high-level plotting functions, consider adding a small example to the *examples gallery*.
- If you add a major new feature or change the API in a backward-incompatible way, please document it as described in *API guidelines*.
- Code should follow our conventions as documented in our *Coding guidelines*.
- When adding or changing public function signatures, add *type hints*.
- When adding keyword arguments, see our guide to *Keyword argument processing*.

When opening a pull request on Github, please ensure that:

- Changes were made on a *feature branch*.
- *pre-commit* checks for spelling, formatting, etc pass
- The pull request targets the *main branch*
- If your pull request addresses an issue, please use the title to describe the issue (e.g. "Add ability to plot timedeltas") and mention the issue number in the pull request description to ensure that a link is created to the original issue (e.g. "Closes #8869" or "Fixes #8869"). This will ensure the original issue mentioned is automatically closed when your PR is merged. For more details, see linking an issue and pull request.
- *Automated tests* pass

For guidance on creating and managing a pull request, please see our *contributing* and *pull request workflow* guides.

### Summary for pull request reviewers

**Please help review and merge PRs!**

If you have commit rights, then you are trusted to use them. Please be patient and kind with contributors.

When reviewing, please ensure that the pull request satisfies the following requirements before merging it:

### Content

- Is the feature / bugfix reasonable?
- Does the PR conform with the *Coding guidelines*?
- Is the *documentation* (docstrings, examples, what's new, API changes) updated?
- Is the change purely stylistic? Generally, such changes are discouraged when not part of other non-stylistic work because it obscures the git history of functional changes to the code. Reflowing a method or docstring as part of a larger refactor/rewrite is acceptable.

### Workflow

- Make sure all *automated tests* pass.
- The PR should *target the main branch*.
- Tag with descriptive *labels*.
- Set the *milestone*.
- Keep an eye on the *number of commits*.
- Approve if all of the above topics are handled.
- *Merge* if a sufficient number of approvals is reached.

### Detailed guidelines

### Documentation

- Every new feature should be documented. If it's a new module, don't forget to add a new rst file to the API docs.
- Each high-level plotting function should have a small example in the `Examples` section of the docstring. This should be as simple as possible to demonstrate the method. More complex examples should go into a dedicated example file in the `examples` directory, which will be rendered to the examples gallery in the documentation.
- Build the docs and make sure all formatting warnings are addressed.
- See *Write documentation* for our documentation style guide.

### Labels

- If you have the rights to set labels, tag the PR with descriptive labels. See the list of labels.
- If the PR makes changes to the wheel building Action, add the "Run cibuildwheel" label to enable testing wheels.

### Milestones

Set the milestone according to these guidelines:

- *New features and API changes* are milestoned for the next meso release `v3.N.0`.
- *Bugfixes, tests for released code, and docstring changes* may be milestoned for the next micro release `v3.N.M`.
- *Documentation changes* (only .rst files and examples) may be milestoned `v3.N-doc`.

If multiple rules apply, choose the first matching from the above list. See *Backport strategy* for detailed guidance on what should or should not be backported.

The milestone marks the release a PR should go into. It states intent, but can be changed because of release planning or re-evaluation of the PR scope and maturity.

All Pull Requests should target the main branch. The milestone tag triggers an *automatic backport* for milestones which have a corresponding branch.

### Merging

- Documentation and examples may be merged by the first reviewer. Use the threshold "is this better than it was?" as the review criteria.
- For code changes (anything in `src` or `lib`) at least two core developers (those with commit rights) should review all pull requests. If you are the first to review a PR and approve of the changes use the GitHub 'approve review' tool to mark it as such. If you are a subsequent reviewer please approve the review and if you think no more review is needed, merge the PR.

  Ensure that all API changes are documented in a file in one of the subdirectories of `doc/api/next_api_changes`, and significant new features have an entry in `doc/user/whats_new`.

  - If a PR already has a positive review, a core developer (e.g. the first reviewer, but not necessarily) may champion that PR for merging. In order to do so, they should ping all core devs both on GitHub and on the dev mailing list, and label the PR with the "Merge with single review?" label. Other core devs can then either review the PR and merge or reject it, or simply request that it gets a second review before being merged. If no one asks for such a second review within a week, the PR can then be merged on the basis of that single review.

    A core dev should only champion one PR at a time and we should try to keep the flow of championed PRs reasonable.

- Do not self merge, except for 'small' patches to un-break the CI or when another reviewer explicitly allows it (ex, "Approve modulo CI passing, may self merge when green").

### Automated tests

Before being merged, a PR should pass the *Automated tests*. If you are unsure why a test is failing, ask on the PR or in our *Official communication channels*

### Number of commits and squashing

- Squashing is case-by-case. The balance is between burden on the contributor, keeping a relatively clean history, and keeping a history usable for bisecting. The only time we are really strict about it is to eliminate binary files (ex multiple test image re-generations) and to remove upstream merges.
- Do not let perfect be the enemy of the good, particularly for documentation or example PRs. If you find yourself making many small suggestions, either open a PR against the original branch, push changes to the contributor branch, or merge the PR and then open a new PR against upstream.
- If you push to a contributor branch leave a comment explaining what you did, ex "I took the liberty of pushing a small clean-up PR to your branch, thanks for your work.". If you are going to make substantial changes to the code or intent of the PR please check with the contributor first.

### Branches and backports

### Current branches

The current active branches are

***main***

The current development version. Future meso (*v3.N.0*) or macro (*v4.0.0*) will be branched from this.

***v3.N.x***

Maintenance branch for Matplotlib 3.N. Future micro releases will be tagged from this.

***v3.N.M-doc***

Documentation for the current micro release. On a micro release, this will be replaced by a properly named branch for the new release.

### Branch selection for pull requests

Generally, all pull requests should target the main branch.

Other branches are fed through *automatic* or *manual*. Directly targeting other branches is only rarely necessary for special maintenance work.

### Backport strategy

Backports to the micro release branch (*v3.N.x*) are the changes that will be included in the next patch (aka bug-fix) release. The goal of the patch releases is to fix bugs without adding any new regressions or behavior changes. We will always attempt to backport:

- critical bug fixes (segfault, failure to import, things that the user cannot work around)
- fixes for regressions introduced in the last two meso releases

and may attempt to backport fixes for regressions introduced in older releases.

In the case where the backport is not clean, for example if the bug fix is built on top of other code changes we do not want to backport, balance the effort and risk of re-implementing the bug fix vs the severity of the bug. When in doubt, err on the side of not backporting.

When backporting a Pull Request fails or is declined, re-milestone the original PR to the next meso release and leave a comment explaining why.

The only changes backported to the documentation branch (*v3.N.M-doc*) are changes to `doc` or `galleries`. Any changes to `lib` or `src`, including docstring-only changes, must not be backported to this branch.

### Automated backports

We use MeeseeksDev bot to automatically backport merges to the correct maintenance branch base on the milestone. To work properly the milestone must be set before merging. If you have commit rights, the bot can also be manually triggered after a merge by leaving a message `@meeseeksdev backport to BRANCH` on the PR. If there are conflicts MeeseeksDev will inform you that the backport needs to be done manually.

The target branch is configured by putting `on-merge: backport to TARGETBRANCH` in the milestone description on it's own line.

If the bot is not working as expected, please report issues to MeeseeksDev.

### Manual backports

When doing backports please copy the form used by MeeseeksDev, `Backport PR #XXXX: TITLE OF PR`. If you need to manually resolve conflicts make note of them and how you resolved them in the commit message.

We do a backport from main to v2.2.x assuming:

- `matplotlib` is a read-only remote branch of the matplotlib/matplotlib repo

The `TARGET_SHA` is the hash of the merge commit you would like to backport. This can be read off of the GitHub PR page (in the UI with the merge notification) or through the git CLI tools.

Assuming that you already have a local branch `v2.2.x` (if not, then `git checkout -b v2.2.x`), and that your remote pointing to `https://github.com/matplotlib/matplotlib` is called `upstream`:

```
git fetch upstream
git checkout v2.2.x  # or include -b if you don't already have this.
git reset --hard upstream/v2.2.x
git cherry-pick -m 1 TARGET_SHA
# resolve conflicts and commit if required
```

Files with conflicts can be listed by `git status`, and will have to be fixed by hand (search on >>>>>). Once the conflict is resolved, you will have to re-add the file(s) to the branch and then continue the cherry pick:

```
git add lib/matplotlib/conflicted_file.py
git add lib/matplotlib/conflicted_file2.py
git cherry-pick --continue
```

Use your discretion to push directly to upstream or to open a PR; be sure to push or PR against the `v2.2.x` upstream branch, not `main`!

**Maintenance**

## 10.3.9 Release guide

---

**This document is only relevant for Matplotlib release managers.**

A guide for developers who are doing a Matplotlib release.

---

### Versioning Scheme

Maplotlib follows the Intended Effort Versioning (EffVer) versioning scheme: *macro.meso.micro*.

***macro***

A release that we expect a large effort from our users to upgrade to. The v1 to v2 transition included a complete overhaul of the default styles and the v2 to v3 transition involved dropping support for Python 2.

Future macro versions would include changes of a comparable scale that can not be done incrementally in meso releases.

***meso***

A release that we expect some effort from our users to upgrade to. We target a *Meso* release every 6 months. These release are primarily intended to release new features to our users, however they also contain intentional feature deprecations and removals per *our policy*.

***micro***

A release that we expect users to require little to no effort to upgrade to. Per our *Backport strategy* we only backport bug fixes to the maintenance branch. We expect minimal impact on users other than possibly breaking work arounds to a fixed bug or bugs being used as features.

These are released as-needed, but typically every 1-2 months between meso releases.

### Making the release branch

---

**Note:** This assumes that a read-only remote for the canonical repository is `remote` and a read/write remote is `DANGER`

---

When a new meso release (vX.Y.0) is approaching, a new release branch must be made. When precisely this should happen is up to the release manager, but this point is where most new features intended for the meso release are merged and you are entering a feature freeze (i.e. newly implemented features will be going into vX.Y+1). This does not necessarily mean that no further changes will be made prior to release, just that those changes will be made using the backport system.

For an upcoming `v3.7.0` release, first create the branch:

```
git switch main
git pull
git switch -c v3.7.x
git push DANGER v3.7.x
```

Update the `v3.7.0` milestone so that the description reads:

```
New features and API changes

on-merge: backport to v3.7.x
```

Micro versions should instead read:

```
Bugfixes and docstring changes

on-merge: backport to v3.7.x
```

Check all active milestones for consistency. Older milestones should also backport to higher meso versions (e.g. `v3.6.3` and `v3.6-doc` should backport to both `v3.6.x` and `v3.7.x` once the `v3.7.x` branch exists and while PR backports are still targeting `v3.6.x`)

Create the milestone for the next-next meso release (i.e. `v3.9.0`, as `v3.8.0` should already exist). While most active items should go in the next meso release, this milestone can help with longer term planning, especially around deprecation cycles.

### Testing

We use GitHub Actions for continuous integration. When preparing for a release, the final tagged commit should be tested locally before it is uploaded:

```
pytest -n 8 .
```

In addition the following test should be run and manually inspected:

```
python tools/memleak.py agg 1000 agg.pdf
```

Run the User Acceptance Tests for the NBAgg and ipympl backends:

```
jupyter notebook lib/matplotlib/backends/web_backend/nbagg_uat.ipynb
```

For ipympl, restart the kernel, add a cell for `%matplotlib widget` and do not run the cell with `matplotlib.use('nbagg')`. Tests which check `connection_info`, use `reshow`, or test the OO interface are not expected to work for `ipympl`.

### GitHub statistics

We automatically extract GitHub issue, PRs, and authors from GitHub via the API. To prepare this list:

1. Archive the existing GitHub statistics page.
   a. Copy the current `doc/users/github_stats.rst` to `doc/users/prev_whats_new/github_stats_X.Y.Z.rst`.
   b. Change the link target at the top of the file.
   c. Remove the "Previous GitHub Stats" section at the end.

   For example, when updating from v3.7.0 to v3.7.1:

```
cp doc/users/github_stats.rst doc/users/prev_whats_new/github_stats_3.7.
 ↪0.rst
$EDITOR doc/users/prev_whats_new/github_stats_3.7.0.rst
```

(continues on next page)

(continued from previous page)

```
# Change contents as noted above.
git add doc/users/prev_whats_new/github_stats_3.7.0.rst
```

2. Re-generate the updated stats:

```
python tools/github_stats.py --since-tag v3.7.0 --milestone=v3.7.1 \
    --project 'matplotlib/matplotlib' --links > doc/users/github_stats.
↪rst
```

3. Review and commit changes. Some issue/PR titles may not be valid reST (the most common issue is `*` which is interpreted as unclosed markup).

---

**Note:** Make sure you authenticate against the GitHub API. If you do not, you will get blocked by GitHub for going over the API rate limits. You can authenticate in one of two ways:

- using the `keyring` package; `pip install keyring` and then when running the stats script, you will be prompted for user name and password, that will be stored in your system keyring, or,
- using a personal access token; generate a new token on this GitHub page with the `repo:public_repo` scope and place the token in `~/.ghoauth`.

---

### Update and validate the docs

#### Merge `*-doc` branch

Merge the most recent 'doc' branch (e.g., `v3.7.0-doc`) into the branch you are going to tag on and delete the doc branch on GitHub.

### Update supported versions in Security Policy

When making macro or meso releases, update the supported versions in the Security Policy in `SECURITY.md`.

For meso version release update the table in `SECURITY.md` to specify that the two most recent meso releases in the current macro version series are supported.

For a macro version release update the table in `SECURITY.md` to specify that the last meso version in the previous macro version series is still supported. Dropping support for the last version of a macro version series will be handled on an ad-hoc basis.

### Update release notes

#### What's new

*Only needed for macro and meso releases. Bugfix releases should not have new features.*

Merge the contents of all the files in `doc/users/next_whats_new/` into a single file `doc/users/prev_whats_new/whats_new_X.Y.0.rst` and delete the individual files.

#### API changes

*Primarily needed for macro and meso releases. We may sometimes have API changes in micro releases.*

Merge the contents of all the files in `doc/api/next_api_changes/` into a single file `doc/api/prev_api_changes/api_changes_X.Y.Z.rst` and delete the individual files.

#### Release notes TOC

Update `doc/users/release_notes.rst`:

- For macro and meso releases add a new section

```
X.Y
===
.. toctree::
    :maxdepth: 1

    prev_whats_new/whats_new_X.Y.0.rst
    ../api/prev_api_changes/api_changes_X.Y.0.rst
    prev_whats_new/github_stats_X.Y.0.rst
```

- For micro releases add the GitHub stats and (if present) the API changes to the existing X.Y section

```
../api/prev_api_changes/api_changes_X.Y.Z.rst
prev_whats_new/github_stats_X.Y.Z.rst
```

#### Update version switcher

Update `doc/_static/switcher.json`:

- If a micro release, *X.Y.Z*, no changes are needed.
- If a macro release, *X.Y.0*, change the name of `name: X.Y+1 (dev)` and `name: X.Y (stable)` as well as adding a new version for the previous stable (`name: X.Y-1`).

### Verify that docs build

Finally, make sure that the docs build cleanly:

```
make -Cdoc O=-j$(nproc) html latexpdf
```

After the docs are built, check that all of the links, internal and external, are still valid. We use `linkchecker` for this:

```
pip install linkchecker
pushd doc/build/html
linkchecker index.html --check-extern
popd
```

Address any issues which may arise. The internal links are checked on Circle CI, so this should only flag failed external links.

### Create release commit and tag

To create the tag, first create an empty commit with a very terse set of the release notes in the commit message:

```
git commit --allow-empty
```

and then create a signed, annotated tag with the same text in the body message:

```
git tag -a -s v3.7.0
```

which will prompt you for your GPG key password and an annotation. For pre-releases it is important to follow **PEP 440** so that the build artifacts will sort correctly in PyPI.

To prevent issues with any down-stream builders which download the tarball from GitHub it is important to move all branches away from the commit with the tag[1]:

```
git commit --allow-empty
```

Finally, push the tag to GitHub:

```
git push DANGER v3.7.x v3.7.0
```

[1] The tarball that is provided by GitHub is produced using git archive. We use setuptools_scm which uses a format string in `lib/matplotlib/_version.py` to have `git` insert a list of references to exported commit (see `.gitattributes` for the configuration). This string is then used by `setuptools_scm` to produce the correct version, based on the git tag, when users install from the tarball. However, if there is a branch pointed at the tagged commit, then the branch name will also be included in the tarball. When the branch eventually moves, anyone who checked the hash of the tarball before the branch moved will have an incorrect hash.

To generate the file that GitHub does use:

```
git archive v3.7.0 -o matplotlib-3.7.0.tar.gz --prefix=matplotlib-3.7.0/
```

Congratulations, the scariest part is done! This assumes the release branch has already been made. Usually this is done at the time of feature freeze for a meso release (which often coincides with the last micro release of the previous meso version)

If this is a final release, also create a 'doc' branch (this is not done for pre-releases):

```
git branch v3.7.0-doc
git push DANGER v3.7.0-doc
```

Update (or create) the `v3.7-doc` milestone. The description should include the instruction for meeseeksmachine to backport changes with the `v3.7-doc` milestone to both the `v3.7.x` branch and the `v3.7.0-doc` branch:

```
Documentation changes (.rst files and examples)

on-merge: backport to v3.7.x
on-merge: backport to v3.7.0-doc
```

Check all active milestones for consistency. Older doc milestones should also backport to higher meso versions (e.g. `v3.6-doc` should backport to both `v3.6.x` and `v3.7.x` if the `v3.7.x` branch exists)

### Release management / DOI

Via the GitHub UI, turn the newly pushed tag into a release. If this is a pre-release remember to mark it as such.

For final releases, also get the DOI from Zenodo (which will automatically produce one once the tag is pushed). Add the DOI post-fix and version to the dictionary in `tools/cache_zenodo_svg.py` and run the script.

This will download the new SVG to `doc/_static/zenodo_cache/`*`postfix`*`.svg` and edit `doc/project/citing.rst`. Commit the new SVG, the change to `tools/cache_zenodo_svg.py`, and the changes to `doc/project/citing.rst` to the VER-doc branch and push to GitHub.

```
git checkout v3.7.0-doc
$EDITOR tools/cache_zenodo_svg.py
python tools/cache_zenodo_svg.py
git commit -a
git push DANGER v3.7.0-doc:v3.7.0-doc
```

### Building binaries

We distribute macOS, Windows, and many Linux wheels as well as a source tarball via PyPI. Most builders should trigger automatically once the tag is pushed to GitHub:

- Windows, macOS and manylinux wheels are built on GitHub Actions. Builds are triggered by the GitHub Action defined in `.github/workflows/cibuildwheel.yml`, and wheels will be available as artifacts of the build.

- The auto-tick bot should open a pull request into the conda-forge feedstock. Review and merge (if you have the power to).

**Warning:** Because this is automated, it is extremely important to bump all branches away from the tag as discussed in *Create release commit and tag*.

### Make distribution and upload to PyPI

Once you have collected all of the wheels (expect this to take a few hours), generate the tarball:

```
git checkout v3.7.0
git clean -xfd
python -m build --sdist
```

and copy all of the wheels into `dist` directory. First, check that the dist files are OK:

```
twine check dist/*
```

and then use `twine` to upload all of the files to PyPI

```
twine upload -s dist/matplotlib*tar.gz
twine upload dist/*whl
```

Congratulations, you have now done the second scariest part!

### Build and deploy documentation

To build the documentation you must have the tagged version installed, but build the docs from the `ver-doc` branch. An easy way to arrange this is:

```
pip install matplotlib
pip install -r requirements/doc/doc-requirements.txt
git checkout v3.7.0-doc
git clean -xfd
make -Cdoc O="-t release -j$(nproc)" html latexpdf LATEXMKOPTS="-silent -f"
```

which will build both the HTML and PDF version of the documentation.

The built documentation exists in the matplotlib.github.com repository. Pushing changes to main automatically updates the website.

The documentation is organized in subdirectories by version. The latest stable release is symlinked from the `stable` directory. The documentation for current main is built on Circle CI and pushed to the devdocs repository. These are available at matplotlib.org/devdocs.

Assuming you have this repository checked out in the same directory as matplotlib

```
cd ../matplotlib.github.com
cp -a ../matplotlib/doc/build/html 3.7.0
rm 3.7.0/.buildinfo
cp ../matplotlib/doc/build/latex/Matplotlib.pdf 3.7.0
```

which will copy the built docs over. If this is a final release, link the `stable` subdirectory to the newest version:

```
rm stable
ln -s 3.7.0 stable
```

You will also need to edit `sitemap.xml` to include the newly released version. Now commit and push everything to GitHub

```
git add *
git commit -a -m 'Updating docs for v3.7.0'
git push DANGER main
```

Congratulations you have now done the third scariest part!

If you have access, clear the CloudFlare caches.

It typically takes about 5-10 minutes for the website to process the push and update the live web page (remember to clear your browser cache).

### Merge up changes to main

After a release is done, the changes from the release branch should be merged into the `main` branch. This is primarily done so that the released tag is on the main branch so `git describe` (and thus `setuptools-scm`) has the most current tag. Secondarily, changes made during release (including removing individualized release notes, fixing broken links, and updating the version switcher) are bubbled up to `main`.

Git conflicts are very likely to arise, though aside from changes made directly to the release branch (mostly as part of the release), they should be relatively-easily resolved by using the version from `main`. This is not a universal rule, and care should be taken to ensure correctness:

```
git switch main
git pull
git switch -c merge_up_v3.7.0
git merge v3.7.x
# resolve conflicts
git merge --continue
```

Due to branch protections for the `main` branch, this is merged via a standard pull request, though the PR cleanliness status check is expected to fail. The PR should not be squashed because the intent is to merge the branch histories.

#### Publicize this release

After the release is published to PyPI and conda, it should be announced through our communication channels:

- Send a short version of the release notes and acknowledgments to all the *Mailing lists*
- Post highlights and link to *What's new* on the active *social media accounts*
- Add a release announcement to the "News" section of matplotlib.org by editing `docs/body.html`. Link to the auto-generated announcement discourse post, which is in Announcements > matplotlib-announcements.

#### Conda packages

The Matplotlib project itself does not release conda packages. In particular, the Matplotlib release manager is not responsible for conda packaging.

For information on the packaging of Matplotlib for conda-forge see https://github.com/conda-forge/matplotlib-feedstock.

### 10.3.10 Community management guide

These guidelines are applicable when **acting as a representative** of Matplotlib, for example at sprints or when giving official talks or tutorials, and in any community venue managed by Matplotlib.

Our approach to community engagement is foremost guided by our *Mission Statement*:

- We demonstrate that we care about visualization as a practice
- We deepen our practice and the community's capacity to support users, facilitate exploration, produce high quality visualizations, and be understandable and extensible
- We showcase advanced use of the library without adding maintenance burden to the documentation and recognize contributions that happen outside of the github workflow.
- We use communications platforms to maintain relationships with contributors who may no longer be active on GitHub, build relationships with potential contributors, and connect with other projects and communities who use Matplotlib.
- In prioritizing understandability and extensiblity, we recognize that people using Matplotlib, in whatever capacity, are part of our community. Doing so empowers our community members to build community with each other, for example by creating educational resources, building third party tools, and building informal mentoring networks.

### Official communication channels

The Scientific Python community uses various communications platforms to stay updated on new features and projects, to contribute by telling us what is on their mind and suggest issues and bugs, and to showcase their use cases and the tools they have built.

The following venues are managed by Matplotlib maintainers and contributors:

- library and docs: https://github.com/matplotlib/matplotlib
- forum: https://discourse.matplotlib.org/
- chat: https://matrix.to/#/#matplotlib:matrix.org
- blog: https://blog.scientific-python.org/

### Social media

### Active social media

- https://twitter.com/matplotlib
- https://instagram.com/matplotart/

### Official accounts

- https://bsky.app/profile/matplotlib.bsky.social
- https://fosstodon.org/@matplotlib
- https://www.tiktok.com/@matplotart
- https://www.youtube.com/matplotlib

### Mailing lists

- matplotlib-announce@python.org
- matplotlib-users@python.org
- matplotlib-devel@python.org

### Social media coordination

- Team mailing list: matplotlib-social@numfocus.org
- Public chat room: https://matrix.to/#/#matplotlib_community:gitter.im

### Maintenance

If you are interested in moderating the chat or forum or accessing the social media accounts:

- Matplotlib maintainers should reach out to the community-manager.
- Everyone else should send an email to matplotlib-social-admin@numfocus.org:
  - Introduce yourself - github handle and participation in the community.
  - Describe the reason for wanting to moderate or contribute to social.

### Content guidelines

Communication on official channels, such as the Matplotlib homepage or on Matplotlib social accounts, should conform to the following standards. If you are unsure if content that you would like to post or share meets these guidelines, ask on the *Social media coordination* channels before posting.

### General guidelines

- Focus on Matplotlib, 3rd party packages, and visualizations made with Matplotlib.
- These are also acceptable topics:
  - Visualization best practices and libraries.
  - Projects and initiatives by NumFOCUS and Scientific Python.
  - How to contribute to open source projects.
  - Projects, such as scientific papers, that use Matplotlib.
- No gratuitous disparaging of other visualization libraries and tools, but criticism is acceptable so long as it serves a constructive purpose.
- Follow communication best practices:
  - Do not share non-expert visualizations when it could cause harm:
    - e.g. https://twitter.com/matplotlib/status/1244178154618605568
  - Clearly state when the visualization data/conclusions cannot be verified.
  - Do not rely on machine translations for sensitive visualization.
- Verify sourcing of content (especially on instagram & blog):
  - Instagram/blog: ensure mpl has right to repost/share content

  - Make sure content is clearly cited:
    * e.g. a tutorial reworking an example must credit the original example
- Limited self/corporate promotion is acceptable.
  - Should be no more than about a quarter of the content.

### Visual media guidelines

Visual media, such as images and videos, must not violate the *code of conduct*, nor any platform's rules. Specifically:

- Visual media must conform to the guidelines of all sites it may be posted on:
  - https://help.twitter.com/en/rules-and-policies/twitter-rules
  - https://help.instagram.com/477434105621119
- Emphasize the visualization techniques demonstrated by the visual media.
- Clearly state that sharing is not an endorsement of the content.
  - e.g. bitcoin related visualizations

### Accessibility

Visual media in communications should be made as accessible as possible:

- Add alt text to images and videos when the platform allows:
  - alt text for data viz
  - general alt text guide
- Warn on bright, strobing, images & turn off autoplay if possible.
- For images and videos made by the social media team:
  - Make graphic perceivable to people who cannot perceive color well due to color-blindness, low vision, or any other reason.
  - Do not make bright, strobing images.
  - More guidelines at https://webaim.org/techniques/images/.

### Social media

Matplotlib aims for a single voice across all social media platforms to build and maintain a consistent brand identity for Matplotlib as an organization. This depersonalization is the norm on social media platforms because it enables constructive and productive conversations; People generally feel more comfortable giving negative and constructive feedback to a brand than to specific contributors.

The current Matplotlib voice and persona aims to be kind, patient, supportive and educational. This is so that it can de-escalate tensions and facilitate constructive conversations; being perceived as negative or argumentative can escalate very fast into long-lasting brand damage, being perceived as personal leads to aggression and accusations faster than an impersonal account, and being perceived as friendly and approachable leads to higher engagement. Instead of speaking with a directive authority, which can be intimidating and lead to negative engagement, it speaks as a peer or educator to empower participation. The current voice encourages more input from folks we engage with, and also makes it possible for folks who are not in the core team to participate in managing the account.

While the *brand identity* is casual, the showcased content is high quality, peer-led resource building. Please follow these guidelines to maintain a consistent brand identity across platforms.

### Persona

On social media, Matplotlib:

- Acts as a sentient visualization library, so talks about itself as a we, us, our, and it. Avoids talking about itself in the 3rd person. Never uses 1st person.
- Is very earnest, eager to please, and aims to be patient & painfully oblivious to snark and sarcasm.
- Gets over-excited over shiny visualizations - lots of emojis and the like - and encourages folks to share their work.
- Highlights various parts of the library, especially the more obscure bits and bobbles.
- Acknowledges that it is a sometimes frustrating tangle of bits & bobbles that can confuse even the folks who work on it & signal boosts their confuzzlment.

### Behavior

When acting as a representative of the library, keep responses polite and assume user statements are in good faith unless they violate the *code of conduct*.

### Social graph

Only follow **organizations and projects**, do not follow individual accounts for any reason, even maintainers/project leads/famous Python people!

Following these types of accounts is encouraged:

- NumFocus and Scientific Python projects
- 3rd party packages
- Visualization related projects and organizations
- Open Source community projects
- Sponsors

### Recurring campaigns

Typically the social media accounts will promote the following:

- Matplotlib releases:
  - Highlight new features & major deprecations
  - Link to download/install instructions
  - Ask folks to try it out.
- third party packages
- NumFocus/Scientific Python/open source visualization project releases
- GSOC/GSOD recruiting and progress

### Retired campaigns

- John Hunter Excellence in Plotting, submission and winners

### Changing the guidelines

As the person tasked with implementing these guidelines, the community-manager should be alerted to proposed changes. Similarly, specific platform guidelines (e.g. twitter, instagram) should be reviewed by the person responsible for that platform, when different from the community manager. If there is no consensus, decisions about guidelines revert to the community manager.

### 10.3.11 Dependency version policy

For the purpose of this document, 'minor version' is in the sense of SemVer (major, minor, patch) or 'meso version' in the sense of EffVer (macro, meso, micro). It includes both major/macro and minor/meso releases. For projects that use date-based versioning, every release is a 'minor version'.

Matplotlib follows NEP 29.

#### Python and NumPy

Matplotlib supports:

- All minor versions of Python released 42 months prior to the project, and at minimum the two latest minor versions.
- All minor versions of `numpy` released in the 24 months prior to the project, and at minimum the last three minor versions.

In `pyproject.toml`, the `requires-python` variable should be set to the minimum supported version of Python. All supported minor versions of Python should be in the test matrix and have binary artifacts built for the release.

Minimum Python and NumPy version support should be adjusted upward on every major and minor release, but never on a patch release.

See also the *List of dependency versions*.

#### Python dependencies

For Python dependencies we should support at least:

**with compiled extensions**

minor versions initially released in the 24 months prior to our planned release date or the oldest that support our minimum Python + NumPy

**without compiled extensions**

minor versions initially released in the 12 months prior to our planned release date or the oldest that supports our minimum Python.

We will only bump these dependencies as we need new features or the old versions no longer support our minimum NumPy or Python.

### Test and documentation dependencies

As these packages are only needed for testing or building the docs and not needed by end-users, we can be more aggressive about dropping support for old versions. However, we need to be careful to not over-run what down-stream packagers support (as most of the run the tests and build the documentation as part of the packaging process).

We will support at least minor versions of the development dependencies released in the 12 months prior to our planned release.

We will only bump these as needed or versions no longer support our minimum Python and NumPy.

### System and C-dependencies

For system or C-dependencies (FreeType, GUI frameworks, LaTeX, Ghostscript, FFmpeg) support as old as practical. These can be difficult to install for end-users and we want to be usable on as many systems as possible. We will bump these on a case-by-case basis.

In the case of GUI frameworks for which we rely on Python bindings being available, we will also drop support for bindings so old that they don't support any Python version that we support.

### List of dependency versions

The following list shows the minimal versions of Python and NumPy dependencies for different versions of Matplotlib. Follow the links for the full specification of the dependencies.

| Matplotlib | Python | NumPy |
|---|---|---|
| 3.9 | 3.9 | 1.23.0 |
| 3.8 | 3.9 | 1.21.0 |
| 3.7 | 3.8 | 1.20.0 |
| 3.6 | 3.8 | 1.19.0 |
| 3.5 | 3.7 | 1.17.0 |
| 3.4 | 3.7 | 1.16.0 |
| 3.3 | 3.6 | 1.15.0 |
| 3.2 | 3.6 | 1.11.0 |
| 3.1 | 3.6 | 1.11.0 |
| 3.0 | 3.5 | 1.10.0 |
| 2.2 | 2.7, 3.4 | 1.7.1 |
| 2.1 | 2.7, 3.4 | 1.7.1 |
| 2.0 | 2.7, 3.4 | 1.7.1 |
| 1.5 | 2.7, 3.4 | 1.6 |
| 1.4 | 2.6, 3.3 | 1.6 |
| 1.3 | 2.6, 3.3 | 1.5 |
| 1.2 | 2.6, 3.1 | 1.4 |
| 1.1 | 2.4 | 1.1 |
| 1.0 | 2.4 | 1.1 |

### 10.3.12 Matplotlib Enhancement Proposals

Matplotlib Enhancement Proposals (MEP), inspired by cpython's PEP's but less formal, are design documents for large or controversial changes to Matplotilb. These documents should provide a discussion of both why and how the changes should be made.

To create a new MEP open a pull request (PR) adding a file based on *the template* to this the MEP directory. For the initial PR only a rough description is required and it should be merged quickly. Further detailed discussion can happen in follow on PRs.

#### MEP Template

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

This MEP template is a guideline of the sections that a MEP should contain. Extra sections may be added if appropriate, and unnecessary sections may be noted as such.

#### Status

MEPs go through a number of phases in their lifetime:

- **Discussion**: The MEP is being actively discussed on the mailing list and it is being improved by its author. The mailing list discussion of the MEP should include the MEP number (MEPxxx) in the subject line so they can be easily related to the MEP.
- **Progress**: Consensus was reached and implementation work has begun.
- **Completed**: The implementation has been merged into main.
- **Superseded**: This MEP has been abandoned in favor of another approach.
- **Rejected**: There are currently no plans to implement the proposal.

### Branches and Pull requests

All development branches containing work on this MEP should be linked to from here.

All pull requests submitted relating to this MEP should be linked to from here. (A MEP does not need to be implemented in a single pull request if it makes sense to implement it in discrete phases).

### Abstract

The abstract should be a short description of what the MEP will achieve.

### Detailed description

This section describes the need for the MEP. It should describe the existing problem that it is trying to solve and why this MEP makes the situation better. It should include examples of how the new functionality would be used and perhaps some use cases.

### Implementation

This section lists the major steps required to implement the MEP. Where possible, it should be noted where one step is dependent on another, and which steps may be optionally omitted. Where it makes sense, each step should include a link related pull requests as the implementation progresses.

### Backward compatibility

This section describes the ways in which the MEP breaks backward incompatibility.

### Alternatives

If there were any alternative solutions to solving the same problem, they should be discussed here, along with a justification for the chosen approach.

### MEP8: PEP8

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*

- *Backward compatibility*
- *Alternatives*

## Status

**Superseded**

Current guidelines for style, including usage of pep8 are maintained in our pull request guidelines.

We are currently enforcing a sub-set of pep8 on new code contributions.

## Branches and Pull requests

None so far.

## Abstract

The matplotlib codebase predates PEP8, and therefore is less than consistent style-wise in some areas. Bringing the codebase into compliance with PEP8 would go a long way to improving its legibility.

## Detailed description

Some files use four space indentation, some use three. Some use different levels in the same file.

For the most part, class/function/variable naming follows PEP8, but it wouldn't hurt to fix where necessary.

## Implementation

The implementation should be fairly mechanical: running the pep8 tool over the code and fixing where appropriate.

This should be merged in after the 2.0 release, since the changes will likely make merging any pending pull requests more difficult.

Additionally, and optionally, PEP8 compliance could be tracked by an automated build system.

### Backward compatibility

Public names of classes and functions that require change (there shouldn't be many of these) should first be deprecated and then removed in the next release cycle.

### Alternatives

PEP8 is a popular standard for Python code style, blessed by the Python core developers, making any alternatives less desirable.

## MEP9: Global interaction manager

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Current summary of the mixin*
- *Backward compatibility*
- *Alternatives*

Add a global manager for all user interactivity with artists; make any artist resizeable, moveable, highlightable, and selectable as desired by the user.

### Status

**Discussion**

### Branches and Pull requests

https://github.com/dhyams/matplotlib/tree/MEP9

### Abstract

The goal is to be able to interact with matplotlib artists in a very similar way as drawing programs do. When appropriate, the user should be able to move, resize, or select an artist that is already on the canvas. Of course, the script writer is ultimately in control of whether an artist is able to be interacted with, or whether it is static.

This code to do this has already been privately implemented and tested, and would need to be migrated from its current "mixin" implementation, to a bona-fide part of matplotlib.

The end result would be to have four new keywords available to matplotlib.artist.Artist: _moveable_, _resizeable_, _selectable_, and _highlightable_. Setting any one of these keywords to True would activate interactivity for that artist.

In effect, this MEP is a logical extension of event handling in matplotlib; matplotlib already supports "low level" interactions like left mouse presses, a key press, or similar. The MEP extends the support to the logical level, where callbacks are performed on the artists when certain interactive gestures from the user are detected.

### Detailed description

This new functionality would be used to allow the end-user to better interact with the graph. Many times, a graph is almost what the user wants, but a small repositioning and/or resizing of components is necessary. Rather than force the user to go back to the script to trial-and-error the location, and simple drag and drop would be appropriate.

Also, this would better support applications that use matplotlib; here, the end-user has no reasonable access or desire to edit the underlying source in order to fine-tune a plot. Here, if matplotlib offered the capability, one could move or resize artists on the canvas to suit their needs. Also, the user should be able to highlight (with a mouse over) an artist, and select it with a double-click, if the application supports that sort of thing. In this MEP, we also want to support the highlighting and selection natively; it is up to application to handle what happens when the artist is selected. A typical handling would be to display a dialog to edit the properties of the artist.

In the future, as well (this is not part of this MEP), matplotlib could offer backend-specific property dialogs for each artist, which are raised on artist selection. This MEP would be a necessary stepping stone for that sort of capability.

There are currently a few interactive capabilities in matplotlib (e.g. legend.draggable()), but they tend to be scattered and are not available for all artists. This MEP seeks to unify the interactive interface and make it work for all artists.

The current MEP also includes grab handles for resizing artists, and appropriate boxes drawn when artists are moved or resized.

### Implementation

- Add appropriate methods to the "tree" of artists so that the interactivity manager has a consistent interface for the interactivity manager to deal with. The proposed methods to add to the artists, if they are to support interactivity, are:
  - get_pixel_position_ll(self): get the pixel position of the lower left corner of the artist's bounding box
  - get_pixel_size(self): get the size of the artist's bounding box, in pixels
  - set_pixel_position_and_size(self,x,y,dx,dy): set the new size of the artist, such that it fits within the specified bounding box.
- add capability to the backends to 1) provide cursors, since these are needed for visual indication of moving/resizing, and 2) provide a function that gets the current mouse position
- Implement the manager. This has already been done privately (by dhyams) as a mixin, and has been tested quite a bit. The goal would be to move the functionality of the manager into the artists so that it is in matplotlib properly, and not as a "monkey patch" as I currently have it coded.

### Current summary of the mixin

(Note that this mixin is for now just private code, but can be added to a branch obviously)

InteractiveArtistMixin:

Mixin class to make any generic object that is drawn on a matplotlib canvas moveable and possibly resizeable. The Powerpoint model is followed as closely as possible; not because I'm enamoured with Powerpoint, but because that's what most people understand. An artist can also be selectable, which means that the artist will receive the on_activated() callback when double clicked. Finally, an artist can be highlightable, which means that a highlight is drawn on the artist whenever the mouse passes over. Typically, highlightable artists will also be selectable, but that is left up to the user. So, basically there are four attributes that can be set by the user on a per-artist basis:

- highlightable
- selectable
- moveable
- resizeable

To be moveable (draggable) or resizeable, the object that is the target of the mixin must support the following protocols:

- get_pixel_position_ll(self)
- get_pixel_size(self)
- set_pixel_position_and_size(self,x,y,sx,sy)

Note that nonresizeable objects are free to ignore the sx and sy parameters. To be highlightable, the object that is the target of the mixin must also support the following protocol:

- get_highlight(self)

Which returns a list of artists that will be used to draw the highlight.

If the object that is the target of the mixin is not an matplotlib artist, the following protocols must also be implemented. Doing so is usually fairly trivial, as there has to be an artist *somewhere* that is being drawn. Typically your object would just route these calls to that artist.

- get_figure(self)
- get_axes(self)
- contains(self,event)
- set_animated(self,flag)
- draw(self,renderer)
- get_visible(self)

The following notifications are called on the artist, and the artist can optionally implement these.

- on_select_begin(self)
- on_select_end(self)
- on_drag_begin(self)
- on_drag_end(self)
- on_activated(self)
- on_highlight(self)
- on_right_click(self,event)
- on_left_click(self,event)
- on_middle_click(self,event)
- on_context_click(self,event)
- on_key_up(self,event)
- on_key_down(self,event)

The following notifications are called on the canvas, if no interactive artist handles the event:

- on_press(self,event)
- on_left_click(self,event)
- on_middle_click(self,event)
- on_right_click(self,event)
- on_context_click(self,event)
- on_key_up(self,event)
- on_key_down(self,event)

The following functions, if present, can be used to modify the behavior of the interactive object:

- press_filter(self,event) # determines if the object wants to have the press event routed to it
- handle_unpicked_cursor() # can be used by the object to set a cursor as the cursor passes over the object when it is unpicked.

Supports multiple canvases, maintaining a drag lock, motion notifier, and a global "enabled" flag per canvas. Supports fixed aspect ratio resizings by holding the shift key during the resize.

Known problems:

- Zorder is not obeyed during the selection/drag operations. Because of the blit technique used, I do not believe this can be fixed. The only way I can think of is to search for all artists that have a zorder greater then me, set them all to animated, and then redraw them all on top during each drag refresh. This might be very slow; need to try.
- the mixin only works for wx backends because of two things: 1) the cursors are hardcoded, and 2) there is a call to wx.GetMousePosition() Both of these shortcomings are reasonably fixed by having each backend supply these things.

### Backward compatibility

No problems with backward compatibility, although once this is in place, it would be appropriate to obsolete some of the existing interactive functions (like legend.draggable())

### Alternatives

None that I know of.

### MEP10: Docstring consistency

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
  - *Numpy docstring format*
  - *Cross references*
  - *Overriding signatures*
  - *Linking rather than duplicating*
  - *autosummary extension*
  - *Examples linking to relevant documentation*
  - *Documentation using help() vs. a browser*

- *Implementation*
- *Backward compatibility*
- *Alternatives*

## Status

### Progress

This is still an on-going effort

## Branches and Pull requests

## Abstract

matplotlib has a great deal of inconsistency between docstrings. This not only makes the docs harder to read, but it is harder on contributors, because they don't know which specifications to follow. There should be a clear docstring convention that is followed consistently.

The organization of the API documentation is difficult to follow. Some pages, such as pyplot and axes, are enormous and hard to browse. There should instead be short summary tables that link to detailed documentation. In addition, some of the docstrings themselves are quite long and contain redundant information.

Building the documentation takes a long time and uses a `make.py` script rather than a Makefile.

## Detailed description

There are number of new tools and conventions available since matplotlib started using Sphinx that make life easier. The following is a list of proposed changes to docstrings, most of which involve these new features.

## Numpy docstring format

Numpy docstring format: This format divides the docstring into clear sections, each having different parsing rules that make the docstring easy to read both as raw text and as HTML. We could consider alternatives, or invent our own, but this is a strong choice, as it's well used and understood in the Numpy/Scipy community.

### Cross references

Most of the docstrings in matplotlib use explicit "roles" when linking to other items, for example: `:func:`myfunction``. As of Sphinx 0.4, there is a "default_role" that can be set to "obj", which will polymorphically link to a Python object of any type. This allows one to write `` `myfunction` `` instead. This makes docstrings much easier to read and edit as raw text. Additionally, Sphinx allows for setting a current module, so links like `` `~matplotlib.axes.Axes.set_xlim` `` could be written as `` `~axes.Axes.set_xlim` ``.

### Overriding signatures

Many methods in matplotlib use the `*args` and `**kwargs` syntax to dynamically handle the keyword arguments that are accepted by the function, or to delegate on to another function. This, however, is often not useful as a signature in the documentation. For this reason, many matplotlib methods include something like:

```
def annotate(self, *args, **kwargs):
    """
    Create an annotation: a piece of text referring to a data
    point.

    Call signature::

      annotate(s, xy, xytext=None, xycoords='data',
               textcoords='data', arrowprops=None, **kwargs)
    """
```

This can't be parsed by Sphinx, and is rather verbose in raw text. As of Sphinx 1.1, if the `autodoc_docstring_signature` config value is set to True, Sphinx will extract a replacement signature from the first line of the docstring, allowing this:

```
def annotate(self, *args, **kwargs):
    """
    annotate(s, xy, xytext=None, xycoords='data',
               textcoords='data', arrowprops=None, **kwargs)

    Create an annotation: a piece of text referring to a data
    point.
    """
```

The explicit signature will replace the actual Python one in the generated documentation.

### Linking rather than duplicating

Many of the docstrings include long lists of accepted keywords by interpolating things into the docstring at load time. This makes the docstrings very long. Also, since these tables are the same across many docstrings, it inserts a lot of redundant information in the docs -- particularly a problem in the printed version.

These tables should be moved to docstrings on functions whose only purpose is for help. The docstrings that refer to these tables should link to them, rather than including them verbatim.

### autosummary extension

The Sphinx autosummary extension should be used to generate summary tables, that link to separate pages of documentation. Some classes that have many methods (e.g. *Axes*) should be documented with one method per page, whereas smaller classes should have all of their methods together.

### Examples linking to relevant documentation

The examples, while helpful at illustrating how to use a feature, do not link back to the relevant docstrings. This could be addressed by adding module-level docstrings to the examples, and then including that docstring in the parsed content on the example page. These docstrings could easily include references to any other part of the documentation.

### Documentation using help() vs. a browser

Using Sphinx markup in the source allows for good-looking docs in your browser, but the markup also makes the raw text returned using help() look terrible. One of the aims of improving the docstrings should be to make both methods of accessing the docs look good.

### Implementation

1. The numpydoc extensions should be turned on for matplotlib. There is an important question as to whether these should be included in the matplotlib source tree, or used as a dependency. Installing Numpy is not sufficient to get the numpydoc extensions -- it's a separate install procedure. In any case, to the extent that they require customization for our needs, we should endeavor to submit those changes upstream and not fork them.
2. Manually go through all of the docstrings and update them to the new format and conventions. Updating the cross references (from `` :func:`myfunc` `` to `` `func` ``) may be able to be semi-automated. This is a lot of busy work, and perhaps this labor should be divided on a per-module basis so no single developer is over-burdened by it.
3. Reorganize the API docs using autosummary and `sphinx-autogen`. This should hopefully have minimal impact on the narrative documentation.

4. Modify the example page generator (`gen_rst.py`) so that it extracts the module docstring from the example and includes it in a non-literal part of the example page.
5. Use `sphinx-quickstart` to generate a new-style Sphinx Makefile. The following features in the current `make.py` will have to be addressed in some other way:
   - Copying of some static content
   - Specifying a "small" build (only low-resolution PNG files for examples)

Steps 1, 2, and 3 are interdependent. 4 and 5 may be done independently, though 5 has some dependency on 3.

### Backward compatibility

As this mainly involves docstrings, there should be minimal impact on backward compatibility.

### Alternatives

None yet discussed.

### MEP11: Third-party dependencies

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
  - *Current behavior*
  - *Desired behavior*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

This MEP attempts to improve the way in which third-party dependencies in matplotlib are handled.

### Status

**Completed** -- needs to be merged

### Branches and Pull requests

#1157: Use automatic dependency resolution

#1290: Debundle pyparsing

#1261: Update six to 1.2

### Abstract

One of the goals of matplotlib has been to keep it as easy to install as possible. To that end, some third-party dependencies are included in the source tree and, under certain circumstances, installed alongside matplotlib. This MEP aims to resolve some problems with that approach, bring some consistency, while continuing to make installation convenient.

At the time that was initially done, setuptools, easy_install and PyPI were not mature enough to be relied on. However, at present, we should be able to safely leverage the "modern" versions of those tools, distribute and pip.

While matplotlib has dependencies on both Python libraries and C/C++ libraries, this MEP addresses only the Python libraries so as to not confuse the issue. C libraries represent a larger and mostly orthogonal set of problems.

### Detailed description

matplotlib depends on the following third-party Python libraries:

- Numpy
- dateutil (pure Python)
- pytz (pure Python)
- six -- required by dateutil (pure Python)
- pyparsing (pure Python)
- PIL (optional)
- GUI frameworks: pygtk, gobject, tkinter, PySide, PyQt4, wx (all optional, but one is required for an interactive GUI)

### Current behavior

When installing from source, a **`git`** checkout or pip:

- `setup.py` attempts to `import numpy`. If this fails, the installation fails.
- For each of dateutil, pytz and six, `setup.py` attempts to import them (from the top-level namespace). If that fails, matplotlib installs its local copy of the library into the top-level namespace.
- pyparsing is always installed inside of the matplotlib namespace.

This behavior is most surprising when used with pip, because no pip dependency resolution is performed, even though it is likely to work for all of these packages.

The fact that pyparsing is installed in the matplotlib namespace has reportedly (#1290) confused some users into thinking it is a matplotlib-related module and import it from there rather than the top-level.

When installing using the Windows installer, dateutil, pytz and six are installed at the top-level *always*, potentially overwriting already installed copies of those libraries.

TODO: Describe behavior with the OS-X installer.

When installing using a package manager (Debian, RedHat, MacPorts etc.), this behavior actually does the right thing, and there are no special patches in the matplotlib packages to deal with the fact that we handle dateutil, pytz and six in this way. However, care should be taken that whatever approach we move to continues to work in that context.

Maintaining these packages in the matplotlib tree and making sure they are up-to-date is a maintenance burden. Advanced new features that may require a third-party pure Python library have a higher barrier to inclusion because of this burden.

### Desired behavior

Third-party dependencies are downloaded and installed from their canonical locations by leveraging pip, distribute and PyPI.

dateutil, pytz, and pyparsing should be made into optional dependencies -- though obviously some features would fail if they aren't installed. This will allow the user to decide whether they want to bother installing a particular feature.

### Implementation

For installing from source, and assuming the user has all of the C-level compilers and dependencies, this can be accomplished fairly easily using distribute and following the instructions here. The only anticipated change to the matplotlib library code will be to import pyparsing from the top-level namespace rather than from within matplotlib. Note that distribute will also allow us to remove the direct dependency on six, since it is, strictly speaking, only a direct dependency of dateutil.

For binary installations, there are a number of alternatives (here ordered from best/hardest to worst/easiest):

1. The distutils wininst installer allows a post-install script to run. It might be possible to get this script to run pip to install the other dependencies. (See this thread for someone who has trod that ground before).
2. Continue to ship dateutil, pytz, six and pyparsing in our installer, but use the post-install-script to install them *only* if they cannot already be found.
3. Move all of these packages inside a (new) `matplotlib.extern` namespace so it is clear for outside users that these are external packages. Add some conditional imports in the core matplotlib codebase so dateutil (at the top-level) is tried first, and failing that `matplotlib.extern.dateutil` is used.

2 and 3 are undesirable as they still require maintaining copies of these packages in our tree -- and this is exacerbated by the fact that they are used less -- only in the binary installers. None of these 3 approaches address Numpy, which will still have to be manually installed using an installer.

TODO: How does this relate to the Mac OS-X installer?

### Backward compatibility

At present, matplotlib can be installed from source on a machine without the third party dependencies and without an internet connection. After this change, an internet connection (and a working PyPI) will be required to install matplotlib for the first time. (Subsequent matplotlib updates or development work will run without accessing the network).

### Alternatives

Distributing binary eggs doesn't feel like a usable solution. That requires getting easy_install installed first, and Windows users generally prefer the well known `.exe` or `.msi` installer that works out of the box.

## MEP12: Improve Gallery and Examples

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
  - *Gallery sections*
  - *Clean up guidelines*
    - *Additional suggestions*
- *Backward compatibility*

- *Alternatives*
  - *Tags*

## Status

### Progress

Initial changes added in 1.3. Conversion of the gallery is on-going. 29 September 2015 - The last `pylab_examples` where `pylab` is imported has been converted over to use *`matplotlib.pyplot`* and `numpy`.

## Branches and Pull requests

#1623, #1924, #2181

PR #2474 demonstrates a single example being cleaned up and moved to the appropriate section.

## Abstract

Reorganizing the matplotlib plot gallery would greatly simplify navigation of the gallery. In addition, examples should be cleaned-up and simplified for clarity.

## Detailed description

The matplotlib gallery was recently set up to split examples up into sections. As discussed in that PR[1], the current example sections (`api`, `pylab_examples`) aren't terribly useful to users: New sections in the gallery would help users find relevant examples.

These sections would also guide a cleanup of the examples: Initially, all the current examples would remain and be listed under their current directories. Over time, these examples could be cleaned up and moved into one of the new sections.

This process allows users to easily identify examples that need to be cleaned up; i.e. anything in the `api` and `pylab_examples` directories.

[1] https://github.com/matplotlib/matplotlib/pull/714

### Implementation

1. Create new gallery sections. [Done]
2. Clean up examples and move them to the new gallery sections (over the course of many PRs and with the help of many users/developers). [In progress]

### Gallery sections

The naming of sections is critical and will guide the clean-up effort. The current sections are:

- Lines, bars, and markers (more-or-less 1D data)
- Shapes and collections
- Statistical plots
- Images, contours, and fields
- Pie and polar charts: Round things
- Color
- Text, labels, and annotations
- Ticks and spines
- Subplots, axes, and figures
- Specialty plots (e.g., sankey, radar, tornado)
- Showcase (plots with tweaks to make them publication-quality)
- separate sections for toolboxes (already exists: 'mplot3d', 'axes_grid', 'units', 'widgets')

These names are certainly up for debate. As these sections grow, we should reevaluate them and split them up as necessary.

### Clean up guidelines

The current examples in the `api` and `pylab_examples` sections of the gallery would remain in those directories until they are cleaned up. After clean-up, they would be moved to one of the new gallery sections described above. "Clean-up" should involve:

- sphinx-gallery docstrings: a title and a description of the example formatted as follows, at the top of the example:

```
"""
==============================
Colormaps alter your perception
==============================

Here I plot the function
```

(continues on next page)

(continued from previous page)

```
.. math:: f(x, y) = \sin(x) + \cos(y)

with different colormaps. Look at how colormaps alter your perception!
"""
```

- PEP8 clean-ups (running flake8, or a similar checker, is highly recommended)
- Commented-out code should be removed.
- Replace uses of `pylab` interface with `pyplot` (+ `numpy`, etc.). See c25ef1e
- Remove shebang line, e.g.:

```
#!/usr/bin/env python
```

- Use consistent imports. In particular:

```
import numpy as np

import matplotlib.pyplot as plt
```

  Avoid importing specific functions from these modules (e.g. `from numpy import sin`)

- Each example should focus on a specific feature (excluding `showcase` examples, which will show more "polished" plots). Tweaking unrelated to that feature should be removed. See f7b2217, e57b5fc, and 1458aa8

Use of `pylab` should be demonstrated/discussed on a dedicated help page instead of the gallery examples.

**Note:** When moving an existing example, you should search for references to that example. For example, the API documentation for `axes.py` and `pyplot.py` may use these examples to generate plots. Use your favorite search tool (e.g., grep, ack, grin, pss) to search the matplotlib package. See 2dc9a46 and aa6b410

### Additional suggestions

- Provide links (both ways) between examples and API docs for the methods/objects used. (issue #2222)
- Use `plt.subplots` (note trailing "s") in preference over `plt.subplot`.
- Rename the example to clarify it's purpose. For example, the most basic demo of `imshow` might be `imshow_demo.py`, and one demonstrating different interpolation settings would be `imshow_demo_interpolation.py` (*not* `imshow_demo2.py`).
- Split up examples that try to do too much. See 5099675 and fc2ab07
- Delete examples that don't show anything new.
- Some examples exercise esoteric features for unit testing. These tweaks should be moved out of the gallery to an example in the `unit` directory located in the root directory of the package.
- Add plot titles to clarify intent of the example. See bd2b13c

### Backward compatibility

The website for each Matplotlib version is readily accessible, so users who want to refer to old examples can still do so.

### Alternatives

### Tags

Tagging examples will also help users search the example gallery. Although tags would be a big win for users with specific goals, the plot gallery will remain the entry point to these examples, and sections could really help users navigate the gallery. Thus, tags are complementary to this reorganization.

## MEP13: Use properties for Artists

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Backward compatibility*
- *Examples*
  - *axes.Axes.set_axis_off/set_axis_on*
  - *axes.Axes.get_xlim/set_xlim and get_autoscalex_on/set_autoscalex_on*
  - *axes.Axes.get_title/set_title*
  - *axes.Axes.get_xticklabels/set_xticklabels*
- *Alternatives*

### Status

- **Discussion**

### Branches and Pull requests

None

### Abstract

Wrap all of the matplotlib getter and setter methods with python properties, allowing them to be read and written like class attributes.

### Detailed description

Currently matplotlib uses getter and setter functions (usually prefixed with get_ and set_, respectively) for reading and writing data related to classes. However, since 2.6 python supports properties, which allow such setter and getter functions to be accessed as though they were attributes. This proposal would implement all existing setter and getter methods as properties.

### Implementation

1. All existing getter and setter methods will need to have two aliases, one with the get_ or set_ prefix and one without. Getter methods that currently lack prefixes should be recording in a text file.
2. Classes should be reorganized so setter and getter methods are sequential in the code, with getter methods first.
3. Getter and setter methods that provide additional optional arguments should have those arguments accessible in another manner, either as additional getter or setter methods or attributes of other classes. If those classes are not accessible, getters for them should be added.
4. Property decorators will be added to the setter and getter methods without the prefix. Those with the prefix will be marked as deprecated.
5. Docstrings will need to be rewritten so the getter with the prefix has the current docstring and the getter without the prefix has a generic docstring appropriate for an attribute.
6. Automatic alias generation will need to be modified so it will also create aliases for the properties.
7. All instances of getter and setter method calls will need to be changed to attribute access.
8. All setter and getter aliases with prefixes will be removed

The following steps can be done simultaneously: 1, 2, and 3; 4 and 5; 6 and 7.

Only the following steps must be done in the same release: 4, 5, and 6. All other changes can be done in separate releases. 8 should be done several macro releases after everything else.

### Backward compatibility

All existing getter methods that do not have a prefix (such as get_) will need to be changed from function calls to attribute access. In most cases this will only require removing the parenthesis.

setter and getter methods that have additional optional arguments will need to have those arguments implemented in another way, either as a separate property in the same class or as attributes or properties of another class.

Cases where the setter returns a value will need to be changed to using the setter followed by the getter.

Cases where there are set_ATTR_on() and set_ATTR_off() methods will be changed to ATTR_on properties.

### Examples

#### axes.Axes.set_axis_off/set_axis_on

Current implementation:

```
axes.Axes.set_axis_off()
axes.Axes.set_axis_on()
```

New implementation:

```
True = axes.Axes.axis_on
False = axes.Axes.axis_on
axes.Axes.axis_on = True
axes.Axes.axis_on = False
```

#### axes.Axes.get_xlim/set_xlim and get_autoscalex_on/set_autoscalex_on

Current implementation:

```
[left, right] = axes.Axes.get_xlim()
auto = axes.Axes.get_autoscalex_on()

[left, right] = axes.Axes.set_xlim(left=left, right=right, emit=emit,␣
 ↪auto=auto)
[left, right] = axes.Axes.set_xlim(left=left, right=None, emit=emit,␣
 ↪auto=auto)
[left, right] = axes.Axes.set_xlim(left=None, right=right, emit=emit,␣
 ↪auto=auto)
[left, right] = axes.Axes.set_xlim(left=left, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(right=right, emit=emit, auto=auto)

axes.Axes.set_autoscalex_on(auto)
```

New implementation:

```
[left, right] = axes.Axes.axes_xlim
auto = axes.Axes.autoscalex_on

axes.Axes.axes_xlim = [left, right]
axes.Axes.axes_xlim = [left, None]
axes.Axes.axes_xlim = [None, right]
axes.Axes.axes_xlim[0] = left
axes.Axes.axes_xlim[1] = right

axes.Axes.autoscalex_on = auto

axes.Axes.emit_xlim = emit
```

### axes.Axes.get_title/set_title

Current implementation:

```
string = axes.Axes.get_title()
axes.Axes.set_title(string, fontdict=fontdict, **kwargs)
```

New implementation:

```
string = axes.Axes.title
string = axes.Axes.title_text.text

text.Text = axes.Axes.title_text
text.Text.<attribute> = attribute
text.Text.fontdict = fontdict

axes.Axes.title = string
axes.Axes.title = text.Text
axes.Axes.title_text = string
axes.Axes.title_text = text.Text
```

### axes.Axes.get_xticklabels/set_xticklabels

Current implementation:

```
[text.Text] = axes.Axes.get_xticklabels()
[text.Text] = axes.Axes.get_xticklabels(minor=False)
[text.Text] = axes.Axes.get_xticklabels(minor=True)
[text.Text] = axes.Axes.([string], fontdict=None, **kwargs)
[text.Text] = axes.Axes.([string], fontdict=None, minor=False, **kwargs)
[text.Text] = axes.Axes.([string], fontdict=None, minor=True, **kwargs)
```

New implementation:

```
[text.Text] = axes.Axes.xticklabels
[text.Text] = axes.Axes.xminorticklabels
axes.Axes.xticklabels = [string]
axes.Axes.xminorticklabels = [string]
axes.Axes.xticklabels = [text.Text]
axes.Axes.xminorticklabels = [text.Text]
```

### Alternatives

Instead of using decorators, it is also possible to use the property function. This would change the procedure so that all getter methods that lack a prefix will need to be renamed or removed. This makes handling docstrings more difficult and harder to read.

It is not necessary to deprecate the setter and getter methods, but leaving them in will complicate the code.

This could also serve as an opportunity to rewrite or even remove automatic alias generation.

Another alternate proposal:

Convert `set_xlim`, `set_xlabel`, `set_title`, etc. to `xlim`, `xlabel`, `title`,... to make the transition from `plt` functions to `axes` methods significantly simpler. These would still be methods, not properties, but it's still a great usability enhancement while retaining the interface.

## MEP14: Text handling

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

### Status

- **Discussion**

### Branches and Pull requests

Issue #253 demonstrates a bug where using the bounding box rather than the advance width of text results in misaligned text. This is a minor point in the grand scheme of things, but it should be addressed as part of this MEP.

### Abstract

By reorganizing how text is handled, this MEP aims to:

- improve support for Unicode and non-ltr languages
- improve text layout (especially multi-line text)
- allow support for more fonts, especially non-Apple-format TrueType fonts and OpenType fonts.
- make the font configuration easier and more transparent

### Detailed description

#### Text layout

At present, matplotlib has two different ways to render text: "built-in" (based on FreeType and our own Python code), and "usetex" (based on calling out to a TeX installation). Adjunct to the "built-in" renderer there is also the Python-based "mathtext" system for rendering mathematical equations using a subset of the TeX language without having a TeX installation available. Support for these two engines in strewn about many source files, including every backend, where one finds clauses like

```
if rcParams['text.usetex']: # do one thing else: # do another
```

Adding a third text rendering approach (more on that later) would require editing all of these places as well, and therefore doesn't scale.

Instead, this MEP proposes adding a concept of "text engines", where the user could select one of many different approaches for rendering text. The implementations of each of these would be localized to their own set of modules, and not have little pieces around the whole source tree.

Why add more text rendering engines? The "built-in" text rendering has a number of shortcomings.

- It only handles right-to-left languages, and doesn't handle many special features of Unicode, such as combining diacriticals.
- The multiline support is imperfect and only supports manual line-breaking -- it cannot break up a paragraph into lines of a certain length.
- It also does not handle inline formatting changes in order to support something like Markdown, re-StructuredText or HTML. (Though rich-text formatting is contemplated in this MEP, since we want to make sure this design allows it, the specifics of a rich-text formatting implementation is outside of the scope of this MEP.)

Supporting these things is difficult, and is the "full-time job" of a number of other projects:

- pango/harfbuzz
- QtTextLayout
- Microsoft DirectWrite
- Apple Core Text

Of the above options, it should be noted that harfbuzz is designed from the start as a cross platform option with minimal dependencies, so therefore is a good candidate for a single option to support.

Additionally, for supporting rich text, we could consider using WebKit, and possibly whether than represents a good single cross-platform option. Again, however, rich text formatting is outside of the scope of this project.

Rather than trying to reinvent the wheel and add these features to matplotlib's "built-in" text renderer, we should provide a way to leverage these projects to get more powerful text layout. The "built-in" renderer will still need to exist for reasons of ease of installation, but its feature set will be more limited compared to the others. [TODO: This MEP should clearly decide what those limited features are, and fix any bugs to bring the implementation into a state of working correctly in all cases that we want it to work. I know @leejjoon has some thoughts on this.]

**Font selection**

Going from an abstract description of a font to a file on disk is the task of the font selection algorithm -- it turns out to be much more complicated than it seems at first.

The "built-in" and "usetex" renderers have very different ways of handling font selection, given their different technologies. TeX requires the installation of TeX-specific font packages, for example, and cannot use TrueType fonts directly. Unfortunately, despite the different semantics for font selection, the same set of font properties are used for each. This is true of both the *FontProperties* class and the font-related *rcParams* (which basically share the same code underneath). Instead, we should define a core set of font selection parameters that will work across all text engines, and have engine-specific configuration to allow the user to do engine-specific things when required. For example, it is possible to directly select a font by name in the "built-in" using *rcParams["font.family"]* (default: `['sans-serif']`), but the same is not possible with "usetex". It may be possible to make it easier to use TrueType fonts by using XeTeX, but users will still want to use the traditional metafonts through TeX font packages. So the issue still stands that different text engines will need engine-specific configuration, and it should be more obvious to the user which configuration will work across text engines and which are engine-specific.

Note that even excluding "usetex", there are different ways to find fonts. The default is to use the font list cache in *font_manager* which matches fonts using our own algorithm based on the CSS font matching algorithm. It doesn't always do the same thing as the native font selection algorithms on Linux (fontconfig), Mac and Windows, and it doesn't always find all of the fonts on the system that the OS would normally pick up. However, it is cross-platform, and always finds the fonts that ship with matplotlib. The Cairo and MacOSX backends (and presumably a future HTML5-based backend) currently bypass this mechanism and use the OS-native ones. The same is true when not embedding fonts in SVG, PS or PDF files and opening them in a third-party viewer. A downside there is that (at least with Cairo, need to confirm with MacOSX) they don't always find the fonts we ship with matplotlib. (It may be possible to add the fonts to their search path, though, or we may need to find a way to install our fonts to a location the OS expects to find them).

There are also special modes in the PS and PDF to only use the core fonts that are always available to those formats. There, the font lookup mechanism must only match against those fonts. It is unclear whether the

OS-native font lookup systems can handle this case.

There is also experimental support for using fontconfig for font selection in matplotlib, turned off by default. fontconfig is the native font selection algorithm on Linux, but is also cross platform and works well on the other platforms (though obviously is an additional dependency there).

Many of the text layout libraries proposed above (pango, QtTextLayout, DirectWrite and CoreText etc.) insist on using the font selection library from their own ecosystem.

All of the above seems to suggest that we should move away from our self-written font selection algorithm and use the native APIs where possible. That's what Cairo and MacOSX backends already want to use, and it will be a requirement of any complex text layout library. On Linux, we already have the bones of a fontconfig implementation (which could also be accessed through pango). On Windows and Mac we may need to write custom wrappers. The nice thing is that the API for font lookup is relatively small, and essentially consist of "given a dictionary of font properties, give me a matching font file".

**Font subsetting**

Font subsetting is currently handled using ttconv. ttconv was a standalone commandline utility for converting TrueType fonts to subsetted Type 3 fonts (among other features) written in 1995, which matplotlib (well, I) forked in order to make it work as a library. It only handles Apple-style TrueType fonts, not ones with the Microsoft (or other vendor) encodings. It doesn't handle OpenType fonts at all. This means that even though the STIX fonts come as .otf files, we have to convert them to .ttf files to ship them with matplotlib. The Linux packagers hate this -- they'd rather just depend on the upstream STIX fonts. ttconv has also been shown to have a few bugs that have been difficult to fix over time.

Instead, we should be able to use FreeType to get the font outlines and write our own code (probably in Python) to output subsetted fonts (Type 3 on PS and PDF and paths on SVG). Freetype, as a popular and well-maintained project, handles a wide variety of fonts in the wild. This would remove a lot of custom C code, and remove some code duplication between backends.

Note that subsetting fonts this way, while the easiest route, does lose the hinting in the font, so we will need to continue, as we do now, provide a way to embed the entire font in the file where possible.

Alternative font subsetting options include using the subsetting built-in to Cairo (not clear if it can be used without the rest of Cairo), or using fontforge (which is a heavy and not terribly cross-platform dependency).

**Freetype wrappers**

Our FreeType wrapper could really use a reworking. It defines its own image buffer class (when a Numpy array would be easier). While FreeType can handle a huge diversity of font files, there are limitations to our wrapper that make it much harder to support non-Apple-vendor TrueType files, and certain features of OpenType files. (See #2088 for a terrible result of this, just to support the fonts that ship with Windows 7 and 8). I think a fresh rewrite of this wrapper would go a long way.

**Text anchoring and alignment and rotation**

The handling of baselines was changed in 1.3.0 such that the backends are now given the location of the baseline of the text, not the bottom of the text. This is probably the correct behavior, and the MEP refactoring should also follow this convention.

In order to support alignment on multi-line text, it should be the responsibility of the (proposed) text engine to handle text alignment. For a given chunk of text, each engine calculates a bounding box for that text and

the offset of the anchor point within that box. Therefore, if the va of a block was "top", the anchor point would be at the top of the box.

Rotating of text should always be around the anchor point. I'm not sure that lines up with current behavior in matplotlib, but it seems like the sanest/least surprising choice. [This could be revisited once we have something working]. Rotation of text should not be handled by the text engine -- that should be handled by a layer between the text engine and the rendering backend so it can be handled in a uniform way. [I don't see any advantage to rotation being handled by the text engines individually...]

There are other problems with text alignment and anchoring that should be resolved as part of this work. [TODO: enumerate these].

**Other minor problems to fix**

The mathtext code has backend-specific code -- it should instead provide its output as just another text engine. However, it's still desirable to have mathtext layout inserted as part of a larger layout performed by another text engine, so it should be possible to do this. It's an open question whether embedding the text layout of an arbitrary text engine in another should be possible.

The text mode is currently set by a global rcParam ("text.usetex") so it's either all on or all off. We should continue to have a global rcParam to choose the text engine ("text.layout_engine"), but it should under the hood be an overridable property on the *Text* object, so the same figure can combine the results of multiple text layout engines if necessary.

### Implementation

A concept of a "text engine" will be introduced. Each text engine will implement a number of abstract classes. The `TextFont` interface will represent text for a given set of font properties. It isn't necessarily limited to a single font file -- if the layout engine supports rich text, it may handle a number of font files in a family. Given a `TextFont` instance, the user can get a `TextLayout` instance, which represents the layout for a given string of text in a given font. From a `TextLayout`, an iterator over `TextSpans` is returned so the engine can output raw editable text using as few spans as possible. If the engine would rather get individual characters, they can be obtained from the `TextSpan` instance:

```
class TextFont(TextFontBase):
    def __init__(self, font_properties):
        """
        Create a new object for rendering text using the given font␣
 ↪properties.
        """
        pass

    def get_layout(self, s, ha, va):
        """
        Get the TextLayout for the given string in the given font and
        the horizontal (left, center, right) and verticalalignment (top,
        center, baseline, bottom)
        """
        pass

class TextLayout(TextLayoutBase):
```

(continues on next page)

(continued from previous page)

```
    def get_metrics(self):
        """
        Return the bounding box of the layout, anchored at (0, 0).
        """
        pass

    def get_spans(self):
        """
        Returns an iterator over the spans of different in the layout.
        This is useful for backends that want to editable raw text as
        individual lines.  For rich text where the font may change,
        each span of different font type will have its own span.
        """
        pass

    def get_image(self):
        """
        Returns a rasterized image of the text.  Useful for raster backends,
        like Agg.

        In all likelihood, this will be overridden in the backend, as it can
        be created from get_layout(), but certain backends may want to
        override it if their library provides it (as freetype does).
        """
        pass

    def get_rectangles(self):
        """
        Returns an iterator over the filled black rectangles in the layout.
        Used by TeX and mathtext for drawing, for example, fraction lines.
        """
        pass

    def get_path(self):
        """
        Returns a single Path object of the entire laid out text.

        [Not strictly necessary, but might be useful for textpath
        functionality]
        """
        pass

class TextSpan(TextSpanBase):
    x, y      # Position of the span -- relative to the text layout as a whole
              # where (0, 0) is the anchor.  y is the baseline of the span.
    fontfile  # The font file to use for the span
    text      # The text content of the span

    def get_path(self):
        pass  # See TextLayout.get_path

    def get_chars(self):
```

(continues on next page)

(continued from previous page)

```
        """
        Returns an iterator over the characters in the span.
        """
        pass

class TextChar(TextCharBase):
    x, y      # Position of the character -- relative to the text layout as
              # a whole, where (0, 0) is the anchor.  y is in the baseline
              # of the character.
    codepoint # The unicode code point of the character -- only for␣
 ↪informational
              # purposes, since the mapping of codepoint to glyph_id may have␣
 ↪been
              # handled in a complex way by the layout engine.  This is an int
              # to avoid problems on narrow Unicode builds.
    glyph_id  # The index of the glyph within the font
    fontfile  # The font file to use for the char

    def get_path(self):
        """
        Get the path for the character.
        """
pass
```

Graphic backends that want to output subset of fonts would likely build up a file-global dictionary of characters where the keys are (fontname, glyph_id) and the values are the paths so that only one copy of the path for each character will be stored in the file.

Special casing: The "usetex" functionality currently is able to get Postscript directly from TeX to insert directly in a Postscript file, but for other backends, parses a DVI file and generates something more abstract. For a case like this, `TextLayout` would implement `get_spans` for most backends, but add `get_ps` for the Postscript backend, which would look for the presence of this method and use it if available, or fall back to `get_spans`. This kind of special casing may also be necessary, for example, when the graphics backend and text engine belong to the same ecosystem, e.g. Cairo and Pango, or MacOSX and CoreText.

There are three main pieces to the implementation:

1) Rewriting the freetype wrapper, and removing ttconv.

   a) Once (1) is done, as a proof of concept, we can move to the upstream STIX .otf fonts

   b) Add support for web fonts loaded from a remote URL. (Enabled by using freetype for font subsetting).

2) Refactoring the existing "builtin" and "usetex" code into separate text engines and to follow the API outlined above.

3) Implementing support for advanced text layout libraries.

(1) and (2) are fairly independent, though having (1) done first will allow (2) to be simpler. (3) is dependent on (1) and (2), but even if it doesn't get done (or is postponed), completing (1) and (2) will make it easier to move forward with improving the "builtin" text engine.

### Backward compatibility

The layout of text with respect to its anchor and rotation will change in hopefully small, but improved, ways. The layout of multiline text will be much better, as it will respect horizontal alignment. The layout of bidirectional text or other advanced Unicode features will now work inherently, which may break some things if users are currently using their own workarounds.

Fonts will be selected differently. Hacks that used to sort of work between the "builtin" and "usetex" text rendering engines may no longer work. Fonts found by the OS that weren't previously found by matplotlib may be selected.

### Alternatives

TBD

## MEP15: Fix axis autoscaling when limits are specified for one axis only

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

### Status

**Discussion**

### Branches and Pull requests

None so far.

### Abstract

When one Axis of a 2-dimensional plot is overridden via *set_xlim* or *set_ylim*, automatic scaling of the remaining Axis should be based on the data that falls within the specified limits of the first Axis.

### Detailed description

When axis limits for a 2-D plot are specified for one axis only (via *set_xlim* or *set_ylim*), matplotlib currently does not currently rescale the other axis. The result is that the displayed curves or symbols may be compressed into a tiny portion of the available area, so that the final plot conveys much less information than it would with appropriate axis scaling.

The proposed change of behavior would make matplotlib choose the scale for the remaining axis using only the data that falls within the limits for the axis where limits were specified.

### Implementation

I don't know enough about the internals of matplotlib to be able to suggest an implementation.

### Backward compatibility

From the standpoint of software interfaces, there would be no break in backward compatibility. Some outputs would be different, but if the user truly desires the previous behavior, he/she can achieve this by overriding the axis scaling for both axes.

### Alternatives

The only alternative that I can see is to maintain the status quo.

## MEP19: Continuous Integration

### Status

**Completed**

## Branches and Pull requests

## Abstract

matplotlib could benefit from better and more reliable continuous integration, both for testing and building installers and documentation.

## Detailed description

## Current state-of-the-art

### Testing

matplotlib currently uses Travis-CI for automated tests. While Travis-CI should be praised for how much it does as a free service, it has a number of shortcomings:

- It often fails due to network timeouts when installing dependencies.
- It often fails for inexplicable reasons.
- build or test products can only be saved from build off of branches on the main repo, not pull requests, so it is often difficult to "post mortem" analyse what went wrong. This is particularly frustrating when the failure cannot be subsequently reproduced locally.
- It is not extremely fast. matplotlib's cpu and memory requirements for testing are much higher than the average Python project.
- It only tests on Ubuntu Linux, and we have only minimal control over the specifics of the platform. It can be upgraded at any time outside of our control, causing unexpected delays at times that may not be convenient in our release schedule.

On the plus side, Travis-CI's integration with github -- automatically testing all pending pull requests -- is exceptional.

### Builds

There is no centralized effort for automated binary builds for matplotlib. However, the following disparate things are being done [If the authors mentioned here could fill in detail, that would be great!]:

- @sandrotosi: builds Debian packages
- @takluyver: Has automated Ubuntu builds on Launchpad
- @cgohlke: Makes Windows builds (don't know how automated that is)
- @r-owen: Makes OS-X builds (don't know how automated that is)

### Documentation

Documentation of main is now built by travis and uploaded to https://matplotlib.org/devdocs/index.html

@NelleV, I believe, generates the docs automatically and posts them on the web to chart MEP10 progress.

### Peculiarities of matplotlib

matplotlib has complex requirements that make testing and building more taxing than many other Python projects.

- The CPU time to run the tests is quite high. It puts us beyond the free accounts of many CI services (e.g. ShiningPanda)
- It has a large number of dependencies, and testing the full matrix of all combinations is impractical. We need to be clever about what space we test and guarantee to support.

### Requirements

This section outlines the requirements that we would like to have.

1. Testing all pull requests by hooking into the GitHub API, as Travis-CI does
2. Testing on all major platforms: Linux, Mac OS-X, MS Windows (in that order of priority, based on user survey)
3. Retain the last n days worth of build and test products, to aid in post-mortem debugging.
4. Automated nightly binary builds, so that users can test the bleeding edge without installing a complete compilation environment.
5. Automated benchmarking. It would be nice to have a standard benchmark suite (separate from the tests) whose performance could be tracked over time, in different backends and platforms. While this is separate from building and testing, ideally it would run on the same infrastructure.
6. Automated nightly building and publishing of documentation (or as part of testing, to ensure PRs don't introduce documentation bugs). (This would not replace the static documentation for stable releases as a default).
7. The test systems should be manageable by multiple developers, so that no single person becomes a bottleneck. (Travis-CI's design does this well -- storing build configuration in the git repository, rather than elsewhere, is a very good design.)
8. Make it easy to test a large but sparse matrix of different versions of matplotlib's dependencies. The matplotlib user survey provides some good data as to where to focus our efforts: https://docs.google.com/spreadsheets/d/1jbK0J4cIkyBNncnS-gP7pINSliNy9lI-N4JHwxlNSXE/edit
9. Nice to have: A decentralized design so that those with more obscure platforms can publish build results to a central dashboard.

### Implementation

This part is yet-to-be-written.

However, ideally, the implementation would be a third-party service, to avoid adding system administration to our already stretched time. As we have some donated funds, this service may be a paid one if it offers significant time-saving advantages over free offerings.

### Backward compatibility

Backward compatibility is not a major concern for this MEP. We will replace current tools and procedures with something better and throw out the old.

### Alternatives

### Hangout Notes

### CI Infrastructure

- We like Travis and it will probably remain part of our arsenal in any event. The reliability issues are being looked into.
- Enable Amazon S3 uploads of testing products on Travis. This will help with post-mortem of failures (@mdboom is looking into this now).
- We want Mac coverage. The best bet is probably to push Travis to enable it for our project by paying them for a Pro account (since they don't otherwise allow testing on both Linux and Mac).
- We want Windows coverage. Shining Panda is an option there.
- Investigate finding or building a tool that would collect and synthesize test results from a number of sources and post it to GitHub using the GitHub API. This may be of general use to the Scipy community.
- For both Windows and Mac, we should document (or better yet, script) the process of setting up the machine for a build, and how to build binaries and installers. This may require getting information from Russel Owen and Christoph Gohlke. This is a necessary step for doing automated builds, but would also be valuable for a number of other reasons.

### The test framework itself

- We should investigate ways to make it take less time
  - Eliminating redundant tests, if possible
  - General performance improvements to matplotlib will help
- We should be covering more things, particularly more backends
- We should have more unit tests, fewer integration tests, if possible

### MEP21: color and cm refactor

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

#### Status

- **Discussion**: This MEP has not commenced yet, but here are some ongoing ideas which may become a part of this MEP:

#### Branches and Pull requests

#### Abstract

- color
  - tidy up the namespace
  - Define a "Color" class
  - make it easy to convert from one color type to another `` `hex -> RGB` ``, `` `RGB -> hex` ``, `` `HSV -> RGB` `` etc.
  - improve the construction of a colormap - the dictionary approach is archaic and overly complex (though incredibly powerful)
  - make it possible to interpolate between two or more color types in different modes, especially useful for construction of colormaps in HSV space for instance
- cm
  - rename the module to something more descriptive - mappables?

Overall, there are a lot of improvements that can be made with matplotlib color handling - managing backwards compatibility will be difficult as there are some badly named variables/modules which really shouldn't exist - but a clear path and message for migration should be available, with a large amount of focus on this in the API changes documentation.

Pull Requests:

- Removing the NavigationToolbar classes https://github.com/matplotlib/matplotlib/pull/2740 **CLOSED**
- Keeping the NavigationToolbar classes https://github.com/matplotlib/matplotlib/pull/2759 **CLOSED**
- Navigation by events: https://github.com/matplotlib/matplotlib/pull/3652

### Abstract

The main goal of this MEP is to make it easier to modify (add, change, remove) the way the user interacts with the figures.

The user interaction with the figure is deeply integrated within the Canvas and Toolbar. Making extremely difficult to do any modification.

This MEP proposes the separation of this interaction into Toolbar, Navigation and Tools to provide independent access and reconfiguration.

This approach will make easier to create and share tools among users. In the far future, we can even foresee a kind of Marketplace for `Tools` where the most popular can be added into the main distribution.

### Detailed description

The reconfiguration of the Toolbar is complex, most of the time it requires a custom backend.

The creation of custom Tools sometimes interferes with the Toolbar, as example see https://github.com/matplotlib/matplotlib/issues/2694 also the shortcuts are hardcoded and again not easily modifiable https://github.com/matplotlib/matplotlib/issues/2699

The proposed solution is to take the actions out of the `Toolbar` and the shortcuts out of the `Canvas`. The actions and shortcuts will be in the form of `Tools`.

A new class `Navigation` will be the bridge between the events from the `Canvas` and `Toolbar` and redirect them to the appropriate `Tool`.

At the end the user interaction will be divided into three classes:

- NavigationBase: This class is instantiated for each FigureManager and connect the all user interactions with the Tools
- ToolbarBase: This existing class is relegated only as a GUI access to Tools.
- ToolBase: Is the basic definition of Tools.

### Implementation

### ToolBase(object)

Tools can have a graphical representation as the `SubplotTool` or not even be present in the Toolbar as `Quit`.

The *`ToolBase`* has the following class attributes for configuration at definition time

- keymap = None: Key(s) to be used to trigger the tool
- description = '': Small description of the tool
- image = None: Image that is used in the toolbar

The following instance attributes are set at instantiation:

- name
- navigation

### Methods

- `trigger(self, event)`: This is the main method of the Tool, it is called when the Tool is triggered by:
  - Toolbar button click
  - keypress associated with the Tool Keymap
  - Call to navigation.trigger_tool(name)
- `set_figure(self, figure)`: Set the figure and navigation attributes
- `destroy(self, *args)`: Destroy the `Tool` graphical interface (if exists)

### Available Tools

- ToolQuit
- ToolEnableAllNavigation
- ToolEnableNavigation
- ToolToggleGrid
- ToolToggleFullScreen
- ToolToggleYScale
- ToolToggleXScale
- ToolHome
- ToolBack
- ToolForward
- SaveFigureBase
- ConfigureSubplotsBase

### ToolToggleBase(ToolBase)

The *ToolToggleBase* has the following class attributes for configuration at definition time

- radio_group = None: Attribute to group 'radio' like tools (mutually exclusive)
- cursor = None: Cursor to use when the tool is active

The **Toggleable** Tools, can capture keypress, mouse moves, and mouse button press

### Methods

- `enable(self, event)`: Called by *ToolToggleBase.trigger* method
- `disable(self, event)`: Called when the tool is untoggled
- `toggled`: **Property** True or False

### Available Tools

- ToolZoom
- ToolPan

### NavigationBase

Defines the following attributes:

- canvas:
- keypresslock: Lock to know if the `canvas` `key_press_event` is available and process it
- messagelock: Lock to know if the message is available to write

### Methods (intended for the end user)

- `nav_connect(self, s, func)`: Connect to navigation for events
- `nav_disconnect(self, cid)`: Disconnect from navigation event
- `message_event(self, message, sender=None)`: Emit a tool_message_event event
- `active_toggle(self)`: **Property** The currently toggled tools or None
- `get_tool_keymap(self, name)`: Return a list of keys that are associated with the tool
- `set_tool_keymap(self, name, ``*keys)``: Set the keys for the given tool
- `remove_tool(self, name)`: Removes tool from the navigation control.
- `add_tools(self, tools)`: Add multiple tools to `Navigation`
- `add_tool(self, name, tool, group=None, position=None)`: Add a tool to the `Navigation`
- `tool_trigger_event(self, name, sender=None, canvasevent=None, data=None)`: Trigger a tool and fire the event
- `tools`: **Property** A dict with available tools with corresponding keymaps, descriptions and objects
- `get_tool(self, name)`: Return the tool object

### ToolbarBase

### Methods (for backend implementation)

- `add_toolitem(self, name, group, position, image, description, toggle)`: Add a toolitem to the toolbar. This method is a callback from `tool_added_event` (emitted by navigation)
- `set_message(self, s)`: Display a message on toolbar or in status bar
- `toggle_toolitem(self, name)`: Toggle the toolitem without firing event.
- `remove_toolitem(self, name)`: Remove a toolitem from the `Toolbar`

### Backward compatibility

For backward compatibility added 'navigation' to the list of values supported by *rcParams["toolbar"]* (default: `'toolbar2'`), that is used for `Navigation` classes instantiation instead of the NavigationToolbar classes

With this parameter, it makes it transparent to anyone using the existing backends.

[@pelson comment: This also gives us an opportunity to avoid needing to implement all of this in the same PR - some backends can potentially exist without the new functionality for a short while (but it must be done at some point).]

### MEP23: Multiple Figures per GUI window

- *Status*

- *Detailed description*
- *Implementation*
  - *FigureManagerBase*
  - *new_figure_manager*
  - *new_figure_manager_given_figure*
  - *NavigationBase*
- *Backward compatibility*
- *Alternatives*

### Status

**Discussion**

### Branches and Pull requests

**Previous work** - https://github.com/matplotlib/matplotlib/pull/2465 **To-delete**

### Abstract

Add the possibility to have multiple figures grouped under the same *FigureManager*

### Detailed description

Under the current structure, every canvas has its own window.

This is and may continue to be the desired method of operation for most use cases.

Sometimes when there are too many figures open at the same time, it is desirable to be able to group these under the same window. See PR #2194.

The proposed solution modifies *FigureManagerBase* to contain and manage more than one `Canvas`. The settings parameter *rcParams["backend.multifigure"]* control when the **MultiFigure** behaviour is desired.

**Note**

It is important to note, that the proposed solution, assumes that the MEP22. is already in place. This is simply because the actual implementation of the `Toolbar` makes it pretty hard to switch between canvases.

### Implementation

The first implementation will be done in GTK3 using a Notebook as canvas container.

#### `FigureManagerBase`

will add the following new methods

- `add_canvas`: To add a canvas to an existing *FigureManager* object
- `remove_canvas`: To remove a canvas from a *FigureManager* object, if it is the last one, it will be destroyed
- `move_canvas`: To move a canvas from one *FigureManager* to another.
- `set_canvas_title`: To change the title associated with a specific canvas container
- `get_canvas_title`: To get the title associated with a specific canvas container
- `get_active_canvas`: To get the canvas that is in the foreground and is subject to the gui events. There is no `set_active_canvas` because the active canvas, is defined when `show` is called on a `Canvas` object.

#### new_figure_manager

To control which *FigureManager* will contain the new figures, an extra optional parameter *figuremanager* will be added, this parameter value will be passed to `new_figure_manager_given_figure`.

#### new_figure_manager_given_figure

- If *figuremanager* parameter is given, this *FigureManager* object will be used instead of creating a new one.
- If `rcParams['backend.multifigure']` is True: The last *FigureManager* object will be used instead of creating a new one.

#### NavigationBase

Modifies the `NavigationBase` to keep a list of canvases, directing the actions to the active one.

### Backward compatibility

For the **MultiFigure** properties to be visible, the user has to activate them directly setting `rcParams['backend.multifigure'] = True`

It should be backwards compatible for backends that adhere to the current *FigureManagerBase* structure even if they have not implemented the **MultiFigure** magic yet.

### Alternatives

Instead of modifying the *FigureManagerBase* it could be possible to add a parallel class, that handles the cases where `rcParams['backend.multifigure'] = True`. This will warranty that there won't be any problems with custom made backends, but also makes bigger the code, and more things to maintain.

## MEP24: Negative radius in polar plots

- *Implementation*
- *Related Issues*

- *Backward compatibility*
- *Alternatives*

### Status

*Discussion*

### Branches and Pull requests

None

### Abstract

It is clear that polar plots need to be able to gracefully handle negative r values (not by clipping or reflection).

### Detailed description

One obvious application that we should support is bB plots (see https://github.com/matplotlib/matplotlib/issues/1730#issuecomment-40815837), but this seems more generally useful (for example growth rate as a function of angle). The assumption in the current code (as I understand it) is that the center of the graph is `r==0`, however it would be good to be able to set the center to be at any `r` (with any value less than the offset clipped).

- *Alternatives*

## Status

**Rejected**

This work is important, but this particular effort has stalled.

## Branches and Pull requests

- development branches:
- related pull requests:

## Abstract

This MEP aims at adding a serializable `Controller` objects to act as an `Artist` managers. Users would then communicate changes to an `Artist` via a `Controller`. In this way, functionality of the `Controller` objects may be added incrementally since each `Artist` is still responsible for drawing everything. The goal is to create an API that is usable both by graphing libraries requiring high-level descriptions of figures and libraries requiring low-level interpretations.

## Detailed description

Matplotlib is a core plotting engine with an API that many users already understand. It's difficult/impossible for other graphing libraries to (1) get a complete figure description, (2) output raw data from the figure object as the user has provided it, (3) understand the semantics of the figure objects without heuristics, and (4) give matplotlib a complete figure description to visualize. In addition, because an `Artist` has no conception of its own semantics within the figure, it's difficult to interact with them in a natural way.

In this sense, matplotlib will adopt a standard Model-View-Controller (MVC) framework. The *Model* will be the user defined data, style, and semantics. The *Views* are the ensemble of each individual `Artist`, which are responsible for producing the final image based on the *model*. The *Controller* will be the `Controller` object managing its set of `Artist` objects.

The `Controller` must be able to export the information that it's carrying about the figure on command, perhaps via a `to_json` method or similar. Because it would be extremely extraneous to duplicate all of

the information in the model with the controller, only user-specified information (data + style) are explicitly kept. If a user wants more information (defaults) from the view/model, it should be able to query for it.

- This might be annoying to do, non-specified kwargs are pulled from the rcParams object which is in turn created from reading a user specified file and can be dynamically changed at run time. I suppose we could keep a dict of default defaults and compare against that. Not clear how this will interact with the style sheet [[MEP26]] - @tacaswell

Additional Notes:

- The "raw data" does not necessarily need to be a `list`, `ndarray`, etc. Rather, it can more abstractly just have a method to yield data when needed.
- Because the `Controller` will contain extra information that users may not want to keep around, it should *not* be created by default. You should be able to both (a) instantiate a `Controller` with a figure and (b) build a figure with a `Controller`.

Use Cases:

- Export all necessary informat
- Serializing a matplotlib figure, saving it, and being able to rerun later.
- Any other source sending an appropriately formatted representation to matplotlib to open

### Examples

Here are some examples of what the controllers should be able to do.

1. Instantiate a matplotlib figure from a serialized representation (e.g., JSON):

```
import json
from matplotlib.controllers import Controller
with open('my_figure') as f:
    o = json.load(f)
c = Controller(o)
fig = c.figure
```

2. Manage artists from the controller (e.g., Line2D):

```
# not really sure how this should look
c.axes[0].lines[0].color = 'b'
# ?
```

3. Export serializable figure representation:

```
o = c.to_json()
# or... we should be able to throw a figure object in there too
o = Controller.to_json(mpl_fig)
```

### Implementation

1. Create base `Controller` objects that are able to manage `Artist` objects (e.g., `Hist`)

   Comments:

   - initialization should happen via unpacking `**`, so we need a copy of call signature parameter for the `Artist` we're ultimately trying to control. Unfortunate hard-coded repetition...
   - should the additional `**kwargs` accepted by each `Artist` be tracked at the `Controller`
   - how does a `Controller` know which artist belongs where? E.g., do we need to pass `axes` references?

   Progress:

   - A simple NB demonstrating some functionality for `Line2DController` objects: https://nbviewer.jupyter.org/gist/theengineear/f0aa8d79f64325e767c0

2. Write in protocols for the `Controller` to *update* the model.

   Comments:

   - how should containers be dealt with? E.g., what happens to old patches when we re-bin a histogram?
   - in the link from (1), the old line is completely destroyed and redrawn, what if something is referencing it?

3. Create method by which a json object can be assembled from the `Controllers`
4. Deal with serializing the unserializable aspects of a figure (e.g., non-affine transforms?)
5. Be able to instantiate from a serialized representation
6. Reimplement the existing pyplot and Axes method, e.g. `pyplot.hist` and `Axes.hist` in terms of the new controller class.

> @theengineer: in #2 above, what do you mean by *get updates* from each `Artist`?

^ Yup. The `Controller` *shouldn't* need to get updated. This just happens in #3. Delete comments when you see this.

### Backward compatibility

- pickling will change
- non-affine transformations will require a defined pickling method

### Alternatives

PR #3150 suggested adding semantics by parasitically attaching extra containers to axes objects. This is a more complete solution with what should be a more developed/flexible/powerful framework.

  - *Matplotlib primitives*

### Status

**Rejected**

### Branches and Pull requests

### Abstract

This MEP proposes a new stylesheet implementation to allow more comprehensive and dynamic styling of artists.

The current version of matplotlib (1.4.0) allows stylesheets based on the rcParams syntax to be applied before creation of a plot. The methodology below proposes a new syntax, based on CSS, which would allow styling of individual artists and properties, which can be applied dynamically to existing objects.

This is related to (and makes steps toward) the overall goal of moving to a DOM/tree-like architecture.

### Detailed description

Currently, the look and appearance of existing artist objects (figure, axes, Line2D, etc.) can only be updated via `set_` and `get_` methods on the artist object, which is quite laborious, especially if no reference to the artist(s) has been stored. The new style sheets introduced in 1.4 allow styling before a plot is created, but do not offer any means to dynamically update plots or distinguish between artists of the same type (i.e. to specify the `line color` and `line style` separately for differing *Line2D* objects).

The initial development should concentrate on allowing styling of artist primitives (those *Artist*s that do not contain other *Artist*s), and further development could expand the CSS syntax rules and parser to allow more complex styling. See the appendix for a list of primitives.

The new methodology would require development of a number of steps:

- A new stylesheet syntax (likely based on CSS) to allow selection of artists by type, class, id, etc.
- A mechanism by which to parse a stylesheet into a tree
- A mechanism by which to translate the parse-tree into something which can be used to update the properties of relevant artists. Ideally this would implement a method by which to traverse the artists in a tree-like structure.
- A mechanism by which to generate a stylesheet from existing artist properties. This would be useful to allow a user to export a stylesheet from an existing figure (where the appearance may have been set using the matplotlib API)...

### Implementation

It will be easiest to allow a '3rd party' to modify/set the style of an artist if the 'style' is created as a separate class and store against the artist as a property. The *GraphicsContextBase* class already provides a the basis of a `Style` class and an artist's *draw* method can be refactored to use the `Style` class rather than setting up its own *GraphicsContextBase* and transferring its style-related properties to it. A minimal example of how this could be implemented is shown here: https://github.com/JamesRamm/mpl_experiment

IMO, this will also make the API and code base much neater as individual get/set methods for artist style properties are now redundant... Indirectly related would be a general drive to replace get/set methods with properties. Implementing the style class with properties would be a big stride toward this...

For initial development, I suggest developing a syntax based on a much (much much) simplified version of CSS. I am in favour of dubbing this Artist Style Sheets :+1: :

### BNF Grammar

I propose a very simple syntax to implement initially (like a proof of concept), which can be expanded upon in the future. The BNF form of the syntax is given below and then explained

```
RuleSet ::= SelectorSequence "{"Declaration"}"

SelectorSequence :: = Selector {"," Selector}

Declaration ::= propName":" propValue";"

Selector ::= ArtistIdent{"#"Ident}

propName ::= Ident

propValue ::= Ident | Number | Colour | "None"
```

`ArtistIdent`, `Ident`, `Number` and `Colour` are tokens (the basic building blocks of the expression) which are defined by regular expressions.

### Syntax

A CSS stylesheet consists of a series of **rule sets** in hierarchical order (rules are applied from top to bottom). Each rule follows the syntax

```
selector {attribute: value;}
```

Each rule can have any number of `attribute: value` pairs, and a stylesheet can have any number of rules.

The initial syntax is designed only for *Artist* primitives. It does not address the question of how to set properties on *Container* types (whose properties may themselves be *Artist*s with settable properties), however, a future solution to this could simply be nested `RuleSets`

### Selectors

Selectors define the object to which the attribute updates should be applied. As a starting point, I propose just 2 selectors to use in initial development:

Artist Type Selector

Select an *Artist* by it's type. E.g *Line2D* or *Text*:

```
Line2D {attribute: value}
```

The regex for matching the artist type selector (ArtistIdent in the BNF grammar) would be:

```
ArtistIdent = r'(?P<ArtistIdent>\bLine2D\b|\bText\b|\bAxesImage\b|\
 ↪bFigureImage\b|\bPatch\b)'
```

### GID selector

Select an *Artist* by its gid:

```
Line2D#myGID {attribute: value}
```

A gid can be any string, so the regex could be as follows:

```
Ident = r'(?P<Ident>[a-zA-Z_][a-zA-Z_0-9]*)'
```

The above selectors roughly correspond to their CSS counterparts (http://www.w3.org/TR/CSS21/selector.html)

### Attributes and values

- Attributes are any valid (settable) property for the *Artist* in question.
- Values are any valid value for the property (Usually a string, or number).

### Parsing

Parsing would consist of breaking the stylesheet into tokens (the python cookbook gives a nice tokenizing recipe on page 66), applying the syntax rules and constructing a Tree. This requires defining the grammar of the stylesheet (again, we can borrow from CSS) and writing a parser. Happily, there is a recipe for this in the python cookbook as well.

### Visitor pattern for matplotlib figure

In order to apply the stylesheet rules to the relevant artists, we need to 'visit' each artist in a figure and apply the relevant rule. Here is a visitor class (again, thanks to python cookbook), where each `node` would be an artist in the figure. A `visit_` method would need to be implemented for each mpl artist, to handle the different properties for each

```
class Visitor:
    def visit(self, node):
        name = 'visit_' + type(node).__name__
        meth = getattr(self, name, None)
        if meth is None:
            raise NotImplementedError
        return meth(node)
```

An `evaluator` class would then take the stylesheet rules and implement the visitor on each one of them.

### Backward compatibility

Implementing a separate `Style` class would break backward compatibility as many get/set methods on an artist would become redundant. While it would be possible to alter these methods to hook into the `Style` class (stored as a property against the artist), I would be in favor of simply removing them to both neaten/simplify the codebase and to provide a simple, uncluttered API...

### Alternatives

No alternatives, but some of the ground covered here overlaps with MEP25, which may assist in this development

### Appendix

### Matplotlib primitives

This will form the initial selectors which stylesheets can use.

- Line2D
- Text
- AxesImage
- FigureImage
- Patch

### MEP27: Decouple pyplot from backends

Backend specific branch diffs:

- https://github.com/OceanWolf/matplotlib/compare/backend-refactor...OceanWolf:backend-refactor-tkagg
- https://github.com/OceanWolf/matplotlib/compare/backend-refactor...OceanWolf:backend-refactor-qt
- https://github.com/OceanWolf/matplotlib/compare/backend-refactor...backend-refactor-wx

## Abstract

This MEP refactors the backends to give a more structured and consistent API, removing generic code and consolidate existing code. To do this we propose splitting:

1. `FigureManagerBase` and its derived classes into the core functionality class `FigureManager` and a backend specific class `WindowBase` and
2. `ShowBase` and its derived classes into `Gcf.show_all` and `MainLoopBase`.

### Detailed description

This MEP aims to consolidate the backends API into one single uniform API, removing generic code out of the backend (which includes `_pylab_helpers` and `Gcf`), and push code to a more appropriate level in matplotlib. With this we automatically remove inconsistencies that appear in the backends, such as `FigureManagerBase.resize(w, h)` which sometimes sets the canvas, and other times set the entire window to the dimensions given, depending on the backend.

Two main places for generic code appear in the classes derived from `FigureManagerBase` and `ShowBase`.

1. `FigureManagerBase` has **three** jobs at the moment:
    1. The documentation describes it as a *Helper class for pyplot mode, wraps everything up into a neat bundle*
    2. But it doesn't just wrap the canvas and toolbar, it also does all of the windowing tasks itself. The conflation of these two tasks gets seen the best in the following line: `self.set_window_title("Figure %d" % num)` This combines backend specific code `self.set_window_title(title)` with matplotlib generic code `title = "Figure %d" % num`.
    3. Currently the backend specific subclass of `FigureManager` decides when to end the mainloop. This also seems very wrong as the figure should have no control over the other figures.
2. `ShowBase` has two jobs:
    1. It has the job of going through all figure managers registered in `_pylab_helpers.Gcf` and telling them to show themselves.
    2. And secondly it has the job of performing the backend specific `mainloop` to block the main programme and thus keep the figures from dying.

### Implementation

The description of this MEP gives us most of the solution:

1. To remove the windowing aspect out of `FigureManagerBase` letting it simply wrap this new class along with the other backend classes. Create a new `WindowBase` class that can handle this functionality, with pass-through methods (:arrow_right:) to `WindowBase`. Classes that subclass `WindowBase` should also subclass the GUI specific window class to ensure backward compatibility (`manager.window == manager.window`).
2. Refactor the mainloop of `ShowBase` into `MainLoopBase`, which encapsulates the end of the loop as well. We give an instance of `MainLoop` to `FigureManager` as a key unlock the exit method (requiring all keys returned before the loop can die). Note this opens the possibility for multiple backends to run concurrently.
3. Now that `FigureManagerBase` has no backend specifics in it, to rename it to `FigureManager`, and move to a new file `backend_managers.py` noting that:

1. This allows us to break up the conversion of backends into separate PRs as we can keep the existing `FigureManagerBase` class and its dependencies intact.
2. And this also anticipates MEP22 where the new `NavigationBase` has morphed into a backend independent `ToolManager`.

| FigureManagerBase(canvas, num) | FigureManager(figure, num) | `WindowBase(title)` | Notes |
|---|---|---|---|
| show | | show | |
| destroy | calls destroy on all components | destroy | |
| full_screen_toggle | handles logic | set_fullscreen | |
| resize | | resize | |
| key_press | key_press | | |
| get_window_title | | get_window_title | |
| set_window_title | | set_window_title | |
| | _get_toolbar | | A common method to all subclasses of FigureManagerBase |
| | | set_default_size | |
| | | add_element_to_ | |

| ShowBase | MainLoopBase | Notes |
|---|---|---|
| mainloop | begin | |
| | end | Gets called automagically when no more instances of the subclass exist |
| __call__ | | Method moved to Gcf.show_all |

### Future compatibility

As eluded to above when discussing MEP 22, this refactor makes it easy to add in new generic features. At the moment, MEP 22 has to make ugly hacks to each class extending from `FigureManagerBase`. With this code, this only needs to get made in the single `FigureManager` class. This also makes the later deprecation of `NavigationToolbar2` very straightforward, only needing to touch the single `FigureManager` class

MEP 23 makes for another use case where this refactored code will come in very handy.

### Backward compatibility

As we leave all backend code intact, only adding missing methods to existing classes, this should work seamlessly for all use cases. The only difference will lie for backends that used `FigureManager.resize` to resize the canvas and not the window, due to the standardisation of the API.

I would envision that the classes made obsolete by this refactor get deprecated and removed on the same timetable as `NavigationToolbar2`, also note that the change in call signature to the `FigureCanvasWx` constructor, while backward compatible, I think the old (imho ugly style) signature should get deprecated and removed in the same manner as everything else.

| backend | manager.resize(w,h) | Extra |
|---|---|---|
| gtk3 | window | |
| Tk | canvas | |
| Qt | window | |
| Wx | canvas | FigureManagerWx had `frame` as an alias to window, so this also breaks BC. |

### Alternatives

If there were any alternative solutions to solving the same problem, they should be discussed here, along with a justification for the chosen approach.

### Questions

Mdehoon: Can you elaborate on how to run multiple backends concurrently?

OceanWolf: @mdehoon, as I say, not for this MEP, but I see this MEP opens it up as a future possibility. Basically the `MainLoopBase` class acts a per backend Gcf, in this MEP it tracks the number of figures open per backend, and manages the mainloops for those backends. It closes the backend specific mainloop when it detects that no figures remain open for that backend. Because of this I imagine that with only a small amount of tweaking that we can do full-multi-backend matplotlib. No idea yet why one would want to, but I leave the possibility there in MainLoopBase. With all the backend-code specifics refactored out of `FigureManager` also aids in this, one manager to rule them (the backends) all.

Mdehoon: @OceanWolf, OK, thanks for the explanation. Having a uniform API for the backends is very important for the maintainability of matplotlib. I think this MEP is a step in the right direction.

## MEP28: Remove Complexity from Axes.boxplot

**Discussion**

### Branches and Pull requests

The following lists any open PRs or branches related to this MEP:

1. Deprecate redundant statistical kwargs in `Axes.boxplot`: https://github.com/phobson/matplotlib/tree/MEP28-initial-deprecations
2. Deprecate redundant style options in `Axes.boxplot`: https://github.com/phobson/matplotlib/tree/MEP28-initial-deprecations
3. Deprecate passings 2D NumPy arrays as input: None
4. Add pre- & post-processing options to `cbook.boxplot_stats`: https://github.com/phobson/matplotlib/tree/boxplot-stat-transforms
5. Exposing `cbook.boxplot_stats` through `Axes.boxplot` kwargs: None

6. Remove redundant statistical kwargs in `Axes.boxplot`: None
7. Remove redundant style options in `Axes.boxplot`: None
8. Remaining items that arise through discussion: None

### Abstract

Over the past few releases, the `Axes.boxplot` method has grown in complexity to support fully customizable artist styling and statistical computation. This lead to `Axes.boxplot` being split off into multiple parts. The statistics needed to draw a boxplot are computed in `cbook.boxplot_stats`, while the actual artists are drawn by `Axes.bxp`. The original method, `Axes.boxplot` remains as the most public API that handles passing the user-supplied data to `cbook.boxplot_stats`, feeding the results to `Axes.bxp`, and pre-processing style information for each facet of the boxplot plots.

This MEP will outline a path forward to rollback the added complexity and simplify the API while maintaining reasonable backwards compatibility.

### Detailed description

Currently, the `Axes.boxplot` method accepts parameters that allow the users to specify medians and confidence intervals for each box that will be drawn in the plot. These were provided so that advanced users could provide statistics computed in a different fashion that the simple method provided by matplotlib. However, handling this input requires complex logic to make sure that the forms of the data structure match what needs to be drawn. At the moment, that logic contains 9 separate if/else statements nested up to 5 levels deep with a for loop, and may raise up to 2 errors. These parameters were added prior to the creation of the `Axes.bxp` method, which draws boxplots from a list of dictionaries containing the relevant statistics. Matplotlib also provides a function that computes these statistics via `cbook.boxplot_stats`. Note that advanced users can now either a) write their own function to compute the stats required by `Axes.bxp`, or b) modify the output returned by `cbook.boxplots_stats` to fully customize the position of the artists of the plots. With this flexibility, the parameters to manually specify only the medians and their confidences intervals remain for backwards compatibility.

Around the same time that the two roles of `Axes.boxplot` were split into `cbook.boxplot_stats` for computation and `Axes.bxp` for drawing, both `Axes.boxplot` and `Axes.bxp` were written to accept parameters that individually toggle the drawing of all components of the boxplots, and parameters that individually configure the style of those artists. However, to maintain backwards compatibility, the `sym` parameter (previously used to specify the symbol of the fliers) was retained. This parameter itself requires fairly complex logic to reconcile the `sym` parameters with the newer `flierprops` parameter at the default style specified by `matplotlibrc`.

This MEP seeks to dramatically simplify the creation of boxplots for novice and advanced users alike. Importantly, the changes proposed here will also be available to downstream packages like seaborn, as seaborn smartly allows users to pass arbitrary dictionaries of parameters through the seaborn API to the underlying matplotlib functions.

This will be achieved in the following way:

1. `cbook.boxplot_stats` will be modified to allow pre- and post- computation transformation functions to be passed in (e.g., `np.log` and `np.exp` for lognormally distributed data)
2. `Axes.boxplot` will be modified to also accept and naïvely pass them to `cbook.boxplots_stats` (Alt: pass the stat function and a dict of its optional parameters).
3. Outdated parameters from `Axes.boxplot` will be deprecated and later removed.

### Importance

Since the limits of the whiskers are computed arithmetically, there is an implicit assumption of normality in box and whisker plots. This primarily affects which data points are classified as outliers.

Allowing transformations to the data and the results used to draw boxplots will allow users to opt-out of that assumption if the data are known to not fit a normal distribution.

Below is an example of how `Axes.boxplot` classifies outliers of lognormal data differently depending one these types of transforms.

```
import numpy as np
import matplotlib.pyplot as plt
from matplotlib import cbook
np.random.seed(0)

fig, ax = plt.subplots(figsize=(4, 6))
ax.set_yscale('log')
data = np.random.lognormal(-1.75, 2.75, size=37)

stats = cbook.boxplot_stats(data, labels=['arithmetic'])
logstats = cbook.boxplot_stats(np.log(data), labels=['log-transformed'])

for lsdict in logstats:
    for key, value in lsdict.items():
        if key != 'label':
            lsdict[key] = np.exp(value)

stats.extend(logstats)
ax.bxp(stats)
fig.show()
```

### Implementation

#### Passing transform functions to `cbook.boxplots_stats`

This MEP proposes that two parameters (e.g., `transform_in` and `transform_out` be added to the cookbook function that computes the statistics for the boxplot function. These will be optional keyword-only arguments and can easily be set to `lambda x: x` as a no-op when omitted by the user. The `transform_in` function will be applied to the data as the `boxplot_stats` function loops through each subset

of the data passed to it. After the list of statistics dictionaries are computed the `transform_out` function is applied to each value in the dictionaries.

These transformations can then be added to the call signature of `Axes.boxplot` with little impact to that method's complexity. This is because they can be directly passed to `cbook.boxplot_stats`. Alternatively, `Axes.boxplot` could be modified to accept an optional statistical function kwarg and a dictionary of parameters to be directly passed to it.

At this point in the implementation users and external libraries like seaborn would have complete control via the `Axes.boxplot` method. More importantly, at the very least, seaborn would require no changes to its API to allow users to take advantage of these new options.

### Simplifications to the `Axes.boxplot` API and other functions

Simplifying the boxplot method consists primarily of deprecating and then removing the redundant parameters. Optionally, a next step would include rectifying minor terminological inconsistencies between `Axes.boxplot` and `Axes.bxp`.

The parameters to be deprecated and removed include:

1. `usermedians` - processed by 10 SLOC, 3 `if` blocks, a `for` loop
2. `conf_intervals` - handled by 15 SLOC, 6 `if` blocks, a `for` loop
3. `sym` - processed by 12 SLOC, 4 `if` blocks

Removing the `sym` option allows all code in handling the remaining styling parameters to be moved to `Axes.bxp`. This doesn't remove any complexity, but does reinforce the single responsibility principle among `Axes.bxp`, `cbook.boxplot_stats`, and `Axes.boxplot`.

Additionally, the `notch` parameter could be renamed `shownotches` to be consistent with `Axes.bxp`. This kind of cleanup could be taken a step further and the `whis`, `bootstrap`, `autorange` could be rolled into the kwargs passed to the new `statfxn` parameter.

### Backward compatibility

Implementation of this MEP would eventually result in the backwards incompatible deprecation and then removal of the keyword parameters `usermedians`, `conf_intervals`, and `sym`. Cursory searches on GitHub indicated that `usermedians`, `conf_intervals` are used by few users, who all seem to have a very strong knowledge of matplotlib. A robust deprecation cycle should provide sufficient time for these users to migrate to a new API.

Deprecation of `sym` however, may have a much broader reach into the matplotlib userbase.

### Schedule

An accelerated timeline could look like the following:

1. v2.0.1 add transforms to `cbook.boxplots_stats`, expose in `Axes.boxplot`
2. v2.1.0 Initial Deprecations , and using 2D NumPy arrays as input
    a. Using 2D NumPy arrays as input. The semantics around 2D arrays are generally confusing.
    b. `usermedians`, `conf_intervals`, `sym` parameters
3. v2.2.0
    a. remove `usermedians`, `conf_intervals`, `sym` parameters
    b. deprecate `notch` in favor of `shownotches` to be consistent with other parameters and `Axes.bxp`
4. v2.3.0
    a. remove `notch` parameter
    b. move all style and artist toggling logic to `Axes.bxp` such `Axes.boxplot` is little more than a broker between `Axes.bxp` and `cbook.boxplots_stats`

### Anticipated Impacts to Users

As described above deprecating `usermedians` and `conf_intervals` will likely impact few users. Those who will be impacted are almost certainly advanced users who will be able to adapt to the change.

Deprecating the `sym` option may import more users and effort should be taken to collect community feedback on this.

### Anticipated Impacts to Downstream Libraries

The source code (GitHub master as of 2016-10-17) was inspected for seaborn and python-ggplot to see if these changes would impact their use. None of the parameters nominated for removal in this MEP are used by seaborn. The seaborn APIs that use matplotlib's boxplot function allow user's to pass arbitrary `**kwargs` through to matplotlib's API. Thus seaborn users with modern matplotlib installations will be able to take full advantage of any new features added as a result of this MEP.

Python-ggplot has implemented its own function to draw boxplots. Therefore, no impact can come to it as a result of implementing this MEP.

### Alternatives

### Variations on the theme

This MEP can be divided into a few loosely coupled components:

1. Allowing pre- and post-computation transformation function in `cbook.boxplot_stats`
2. Exposing that transformation in the `Axes.boxplot` API
3. Removing redundant statistical options in `Axes.boxplot`
4. Shifting all styling parameter processing from `Axes.boxplot` to `Axes.bxp`.

With this approach, #2 depends and #1, and #4 depends on #3.

There are two possible approaches to #2. The first and most direct would be to mirror the new `transform_in` and `transform_out` parameters of `cbook.boxplot_stats` in `Axes.boxplot` and pass them directly.

The second approach would be to add `statfxn` and `statfxn_args` parameters to `Axes.boxplot`. Under this implementation, the default value of `statfxn` would be `cbook.boxplot_stats`, but users could pass their own function. Then `transform_in` and `transform_out` would then be passed as elements of the `statfxn_args` parameter.

```
def boxplot_stats(data, ..., transform_in=None, transform_out=None):
    if transform_in is None:
        transform_in = lambda x: x

    if transform_out is None:
        transform_out = lambda x: x

    output = []
    for _d in data:
        d = transform_in(_d)
        stat_dict = do_stats(d)
        for key, value in stat_dict.item():
            if key != 'label':
                stat_dict[key] = transform_out(value)
        output.append(d)
    return output

 class Axes(...):
     def boxplot_option1(data, ..., transform_in=None, transform_out=None):
         stats = cbook.boxplot_stats(data, ...,
                                     transform_in=transform_in,
                                     transform_out=transform_out)
         return self.bxp(stats, ...)

     def boxplot_option2(data, ..., statfxn=None, **statopts):
         if statfxn is None:
             statfxn = boxplot_stats
```

(continues on next page)

(continued from previous page)

```
        stats = statfxn(data, **statopts)
        return self.bxp(stats, ...)
```

Both cases would allow users to do the following:

```
fig, ax1 = plt.subplots()
artists1 = ax1.boxplot_optionX(data, transform_in=np.log,
                               transform_out=np.exp)
```

But Option Two lets a user write a completely custom stat function (e.g., `my_box_stats`) with fancy BCA confidence intervals and the whiskers set differently depending on some attribute of the data.

This is available under the current API:

```
fig, ax1 = plt.subplots()
my_stats = my_box_stats(data, bootstrap_method='BCA',
                        whisker_method='dynamic')
ax1.bxp(my_stats)
```

And would be more concise with Option Two

```
fig, ax = plt.subplots()
statopts = dict(transform_in=np.log, transform_out=np.exp)
ax.boxplot(data, ..., **statopts)
```

Users could also pass their own function to compute the stats:

```
fig, ax1 = plt.subplots()
ax1.boxplot(data, statfxn=my_box_stats, bootstrap_method='BCA',
            whisker_method='dynamic')
```

From the examples above, Option Two seems to have only marginal benefit, but in the context of downstream libraries like seaborn, its advantage is more apparent as the following would be possible without any patches to seaborn:

```
import seaborn
tips = seaborn.load_data('tips')
g = seaborn.factorplot(x="day", y="total_bill", hue="sex", data=tips,
                       kind='box', palette="PRGn", shownotches=True,
                       statfxn=my_box_stats, bootstrap_method='BCA',
                       whisker_method='dynamic')
```

This type of flexibility was the intention behind splitting the overall boxplot API in the current three functions. In practice however, downstream libraries like seaborn support versions of matplotlib dating back well before the split. Thus, adding just a bit more flexibility to the `Axes.boxplot` could expose all the functionality to users of the downstream libraries with modern matplotlib installation without intervention from the downstream library maintainers.

### Doing less

Another obvious alternative would be to omit the added pre- and post- computation transform functionality in `cbook.boxplot_stats` and `Axes.boxplot`, and simply remove the redundant statistical and style parameters as described above.

### Doing nothing

As with many things in life, doing nothing is an option here. This means we simply advocate for users and downstream libraries to take advantage of the split between `cbook.boxplot_stats` and `Axes.bxp` and let them decide how to provide an interface to that.

## MEP29: Text light markup

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
  - *Improvements*
  - *Problems*
- *Backward compatibility*
- *Alternatives*

### Status

Discussion

### Branches and Pull requests

None at the moment, proof of concept only.

### Abstract

This MEP proposes to add lightweight markup to the text artist.

### Detailed description

Using different size/color/family in a text annotation is difficult because the `text` method accepts argument for size/color/family/weight/etc. that are used for the whole text. But, if one wants, for example, to have different colors, one has to look at the gallery where one such example is provided: *Concatenating text objects with different properties*

This example takes a list of strings as well as a list of colors which makes it cumbersome to use. An alternative would be to use a restricted set of pango-like markup and to interpret this markup.

Some markup examples:

```
Hello <b>world!</b>`
Hello <span color="blue">world!</span>
```

### Implementation

A proof of concept is provided in markup_example.py but it currently only handles the horizontal direction.

### Improvements

- This proof of concept uses regex to parse the text but it may be better to use the html.parser from the standard library.
- Computation of text fragment positions could benefit from the OffsetFrom class. See for example item 5 in Using Complex Coordinates with Annotations

### Problems

- One serious problem is how to deal with text having both LaTeX and HTML-like tags. For example, consider the following:

  ```
  $<b>Bold$</b>
  ```

  Recommendation would be to have mutual exclusion.

### Backward compatibility

None at the moment since it is only a proof of concept

### Alternatives

As proposed by @anntzer, this could be also implemented as improvements to mathtext. For example:

```
r"$\text{Hello \textbf{world}}$"
r"$\text{Hello \textcolor{blue}{world}}$"
r"$\text{Hello \textsf{\small world}}$"
```

# Part VI

# About us

Matplotlib was created by neurobiologist John Hunter to work with EEG data. It grew to be used and developed by many people in many different fields. John's goal was that Matplotlib make easy things easy and hard things possible.

CHAPTER

ELEVEN

# PROJECT INFORMATION

## 11.1 Mission Statement

The Matplotlib developer community develops, maintains, and supports Matplotlib and its extensions to provide data visualization tools for the Scientific Python Ecosystem.

Adapting the requirements *laid out by John Hunter* Matplotlib should:

- Support users of the Scientific Python ecosystem;
- Facilitate interactive data exploration;
- Produce high-quality raster and vector format outputs suitable for publication;
- Provide a simple graphical user interface and support embedding in applications;
- Be understandable and extensible by people familiar with data processing in Python;
- Make common plots easy, and novel or complex visualizations possible.

We believe that a diverse developer community creates the best software, and we welcome anyone who shares our mission, and our values described in the code of conduct.

## 11.2 History

**Note:** The following introductory text was written in 2008 by John D. Hunter (1968-2012), the original author of Matplotlib.

Matplotlib is a library for making 2D plots of arrays in Python. Although it has its origins in emulating the MATLAB graphics commands, it is independent of MATLAB, and can be used in a Pythonic, object-oriented way. Although Matplotlib is written primarily in pure Python, it makes heavy use of NumPy and other extension code to provide good performance even for large arrays.

Matplotlib is designed with the philosophy that you should be able to create simple plots with just a few commands, or just one! If you want to see a histogram of your data, you shouldn't need to instantiate objects, call methods, set properties, and so on; it should just work.

For years, I used to use MATLAB exclusively for data analysis and visualization. MATLAB excels at making nice looking plots easy. When I began working with EEG data, I found that I needed to write applications to interact with my data, and developed an EEG analysis application in MATLAB. As the application grew in complexity, interacting with databases, http servers, manipulating complex data structures, I began to strain against the limitations of MATLAB as a programming language, and decided to start over in Python. Python more than makes up for all of MATLAB's deficiencies as a programming language, but I was having difficulty finding a 2D plotting package (for 3D VTK more than exceeds all of my needs).

When I went searching for a Python plotting package, I had several requirements:

- Plots should look great - publication quality. One important requirement for me is that the text looks good (antialiased, etc.)
- Postscript output for inclusion with TeX documents
- Embeddable in a graphical user interface for application development
- Code should be easy enough that I can understand it and extend it
- Making plots should be easy

Finding no package that suited me just right, I did what any self-respecting Python programmer would do: rolled up my sleeves and dived in. Not having any real experience with computer graphics, I decided to emulate MATLAB's plotting capabilities because that is something MATLAB does very well. This had the added advantage that many people have a lot of MATLAB experience, and thus they can quickly get up to steam plotting in python. From a developer's perspective, having a fixed user interface (the pylab interface) has been very useful, because the guts of the code base can be redesigned without affecting user code.

The Matplotlib code is conceptually divided into three parts: the *pylab interface* is the set of functions provided by `pylab` which allow the user to create plots with code quite similar to MATLAB figure generating code (*Pyplot tutorial*). The *Matplotlib frontend* or *Matplotlib API* is the set of classes that do the heavy lifting, creating and managing figures, text, lines, plots and so on (*Artist tutorial*). This is an abstract interface that knows nothing about output. The *backends* are device-dependent drawing devices, aka renderers, that transform the frontend representation to hardcopy or a display device (*What is a backend?*). Example backends: PS creates PostScript® hardcopy, SVG creates Scalable Vector Graphics hardcopy, Agg creates PNG output using the high quality Anti-Grain Geometry library that ships with Matplotlib, GTK embeds Matplotlib in a Gtk+ application, GTKAgg uses the Anti-Grain renderer to create a figure and embed it in a Gtk+ application, and so on for PDF, WxWidgets, Tkinter, etc.

Matplotlib is used by many people in many different contexts. Some people want to automatically generate PostScript files to send to a printer or publishers. Others deploy Matplotlib on a web application server to generate PNG output for inclusion in dynamically-generated web pages. Some use Matplotlib interactively from the Python shell in Tkinter on Windows. My primary use is to embed Matplotlib in a Gtk+ EEG application that runs on Windows, Linux and Macintosh OS X.

## 11.3 Contributor Covenant Code of Conduct

### 11.3.1 Our Pledge

We as members, contributors, and leaders pledge to make participation in our community a harassment-free experience for everyone, regardless of age, body size, visible or invisible disability, ethnicity, sex characteristics, gender identity and expression, level of experience, education, socio-economic status, nationality, personal appearance, race, religion, or sexual identity and orientation.

We pledge to act and interact in ways that contribute to an open, welcoming, diverse, inclusive, and healthy community.

### 11.3.2 Our Standards

Examples of behavior that contributes to a positive environment for our community include:

- Demonstrating empathy and kindness toward other people
- Being respectful of differing opinions, viewpoints, and experiences
- Giving and gracefully accepting constructive feedback
- Accepting responsibility and apologizing to those affected by our mistakes, and learning from the experience
- Focusing on what is best not just for us as individuals, but for the overall community

Examples of unacceptable behavior include:

- The use of sexualized language or imagery, and sexual attention or advances of any kind
- Trolling, insulting or derogatory comments, and personal or political attacks
- Public or private harassment
- Publishing others' private information, such as a physical or email address, without their explicit permission
- Other conduct which could reasonably be considered inappropriate in a professional setting

### 11.3.3 Enforcement Responsibilities

Community leaders are responsible for clarifying and enforcing our standards of acceptable behavior and will take appropriate and fair corrective action in response to any behavior that they deem inappropriate, threatening, offensive, or harmful.

Community leaders have the right and responsibility to remove, edit, or reject comments, commits, code, wiki edits, issues, and other contributions that are not aligned to this Code of Conduct, and will communicate reasons for moderation decisions when appropriate.

### 11.3.4 Scope

This Code of Conduct applies within all community spaces, and also applies when an individual is officially representing the community in public spaces. Examples of representing our community include using an official e-mail address, posting via an official social media account, or acting as an appointed representative at an online or offline event.

### 11.3.5 Enforcement

Instances of abusive, harassing, or otherwise unacceptable behavior may be reported to the community leaders responsible for enforcement at matplotlib-coc@numfocus.org which is monitored by the CoC subcommittee or a report can be made using the NumFOCUS Code of Conduct report form. If community leaders cannot come to a resolution about enforcement, reports will be escalated to the NumFocus Code of Conduct committee (conduct@numfocus.org). All complaints will be reviewed and investigated promptly and fairly.

All community leaders are obligated to respect the privacy and security of the reporter of any incident.

### 11.3.6 Enforcement Guidelines

Community leaders will follow these Community Impact Guidelines in determining the consequences for any action they deem in violation of this Code of Conduct:

#### 1. Correction

**Community Impact**: Use of inappropriate language or other behavior deemed unprofessional or unwelcome in the community.

**Consequence**: A private, written warning from community leaders, providing clarity around the nature of the violation and an explanation of why the behavior was inappropriate. A public apology may be requested.

#### 2. Warning

**Community Impact**: A violation through a single incident or series of actions.

**Consequence**: A warning with consequences for continued behavior. No interaction with the people involved, including unsolicited interaction with those enforcing the Code of Conduct, for a specified period of time. This includes avoiding interactions in community spaces as well as external channels like social media. Violating these terms may lead to a temporary or permanent ban.

#### 3. Temporary Ban

**Community Impact**: A serious violation of community standards, including sustained inappropriate behavior.

**Consequence**: A temporary ban from any sort of interaction or public communication with the community for a specified period of time. No public or private interaction with the people involved, including unsolicited interaction with those enforcing the Code of Conduct, is allowed during this period. Violating these terms may lead to a permanent ban.

#### 4. Permanent Ban

**Community Impact**: Demonstrating a pattern of violation of community standards, including sustained inappropriate behavior, harassment of an individual, or aggression toward or disparagement of classes of individuals.

**Consequence**: A permanent ban from any sort of public interaction within the community.

### 11.3.7 Attribution

This Code of Conduct is adapted from the Contributor Covenant, version 2.0, available at https://www.contributor-covenant.org/version/2/0/code_of_conduct.html.

Community Impact Guidelines were inspired by Mozilla's code of conduct enforcement ladder.

For answers to common questions about this code of conduct, see the FAQ at https://www.contributor-covenant.org/faq. Translations are available at https://www.contributor-covenant.org/translations.

## 11.4 Citing Matplotlib

If Matplotlib contributes to a project that leads to a scientific publication, please acknowledge this fact by citing J. D. Hunter, "Matplotlib: A 2D Graphics Environment", Computing in Science & Engineering, vol. 9, no. 3, pp. 90-95, 2007.

## 11.5 License

Matplotlib only uses BSD compatible code, and its license is based on the PSF license. See the Open Source Initiative licenses page for details on individual licenses. Non-BSD compatible licenses (e.g., LGPL) are acceptable in matplotlib toolkits. For a discussion of the motivations behind the licencing choice, see *Licenses for contributed code*.

### 11.5.1 Copyright policy

John Hunter began Matplotlib around 2003. Since shortly before his passing in 2012, Michael Droettboom has been the lead maintainer of Matplotlib, but, as has always been the case, Matplotlib is the work of many.

Prior to July of 2013, and the 1.3.0 release, the copyright of the source code was held by John Hunter. As of July 2013, and the 1.3.0 release, matplotlib has moved to a shared copyright model.

Matplotlib uses a shared copyright model. Each contributor maintains copyright over their contributions to Matplotlib. But, it is important to note that these contributions are typically only changes to the repositories. Thus, the Matplotlib source code, in its entirety, is not the copyright of any single person or institution. Instead, it is the collective copyright of the entire Matplotlib Development Team. If individual contributors want to maintain a record of what changes/contributions they have specific copyright on, they should indicate their copyright in the commit message of the change, when they commit the change to one of the matplotlib repositories.

The Matplotlib Development Team is the set of all contributors to the matplotlib project. A full list can be obtained from the git version control logs.

### 11.5.2 License agreement

#### License agreement for Matplotlib versions 1.3.0 and later

```
License agreement for matplotlib versions 1.3.0 and later
=========================================================

1. This LICENSE AGREEMENT is between the Matplotlib Development Team
("MDT"), and the Individual or Organization ("Licensee") accessing and
otherwise using matplotlib software in source or binary form and its
associated documentation.

2. Subject to the terms and conditions of this License Agreement, MDT
hereby grants Licensee a nonexclusive, royalty-free, world-wide license
to reproduce, analyze, test, perform and/or display publicly, prepare
derivative works, distribute, and otherwise use matplotlib
alone or in any derivative version, provided, however, that MDT's
License Agreement and MDT's notice of copyright, i.e., "Copyright (c)
2012- Matplotlib Development Team; All Rights Reserved" are retained in
matplotlib  alone or in any derivative version prepared by
Licensee.

3. In the event Licensee prepares a derivative work that is based on or
incorporates matplotlib or any part thereof, and wants to
make the derivative work available to others as provided herein, then
Licensee hereby agrees to include in any such work a brief summary of
the changes made to matplotlib .

4. MDT is making matplotlib available to Licensee on an "AS
IS" basis.  MDT MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR
IMPLIED.  BY WAY OF EXAMPLE, BUT NOT LIMITATION, MDT MAKES NO AND
```

(continued from previous page)

```
DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS
FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF MATPLOTLIB
WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

5. MDT SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF MATPLOTLIB
 FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR
LOSS AS A RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING
MATPLOTLIB , OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF
THE POSSIBILITY THEREOF.

6. This License Agreement will automatically terminate upon a material
breach of its terms and conditions.

7. Nothing in this License Agreement shall be deemed to create any
relationship of agency, partnership, or joint venture between MDT and
Licensee.  This License Agreement does not grant permission to use MDT
trademarks or trade name in a trademark sense to endorse or promote
products or services of Licensee, or any third party.

8. By copying, installing or otherwise using matplotlib ,
Licensee agrees to be bound by the terms and conditions of this License
Agreement.

License agreement for matplotlib versions prior to 1.3.0
========================================================

1. This LICENSE AGREEMENT is between John D. Hunter ("JDH"), and the
Individual or Organization ("Licensee") accessing and otherwise using
matplotlib software in source or binary form and its associated
documentation.

2. Subject to the terms and conditions of this License Agreement, JDH
hereby grants Licensee a nonexclusive, royalty-free, world-wide license
to reproduce, analyze, test, perform and/or display publicly, prepare
derivative works, distribute, and otherwise use matplotlib
alone or in any derivative version, provided, however, that JDH's
License Agreement and JDH's notice of copyright, i.e., "Copyright (c)
2002-2011 John D. Hunter; All Rights Reserved" are retained in
matplotlib  alone or in any derivative version prepared by
Licensee.

3. In the event Licensee prepares a derivative work that is based on or
incorporates matplotlib  or any part thereof, and wants to
make the derivative work available to others as provided herein, then
Licensee hereby agrees to include in any such work a brief summary of
the changes made to matplotlib.

4. JDH is making matplotlib  available to Licensee on an "AS
IS" basis.  JDH MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR
IMPLIED.  BY WAY OF EXAMPLE, BUT NOT LIMITATION, JDH MAKES NO AND
DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS
FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF MATPLOTLIB
```

(continued from previous page)

```
WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

5. JDH SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF MATPLOTLIB
 FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR
LOSS AS A RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING
MATPLOTLIB , OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF
THE POSSIBILITY THEREOF.

6. This License Agreement will automatically terminate upon a material
breach of its terms and conditions.

7. Nothing in this License Agreement shall be deemed to create any
relationship of agency, partnership, or joint venture between JDH and
Licensee.  This License Agreement does not grant permission to use JDH
trademarks or trade name in a trademark sense to endorse or promote
products or services of Licensee, or any third party.

8. By copying, installing or otherwise using matplotlib,
Licensee agrees to be bound by the terms and conditions of this License
Agreement.
```

### 11.5.3 Bundled software

#### JSX Tools Resize Observer

```
# CC0 1.0 Universal

## Statement of Purpose

The laws of most jurisdictions throughout the world automatically confer
exclusive Copyright and Related Rights (defined below) upon the creator and
subsequent owner(s) (each and all, an “owner”) of an original work of
authorship and/or a database (each, a “Work”).

Certain owners wish to permanently relinquish those rights to a Work for the
purpose of contributing to a commons of creative, cultural and scientific␣
 ↪works
(“Commons”) that the public can reliably and without fear of later claims of
infringement build upon, modify, incorporate in other works, reuse and
redistribute as freely as possible in any form whatsoever and for any␣
 ↪purposes,
including without limitation commercial purposes. These owners may contribute
to the Commons to promote the ideal of a free culture and the further
production of creative, cultural and scientific works, or to gain reputation␣
 ↪or
greater distribution for their Work in part through the use and efforts of
others.

For these and/or other purposes and motivations, and without any expectation␣
```

(continues on next page)

(continued from previous page)

```
 ↪of
additional consideration or compensation, the person associating CC0 with a
Work (the “Affirmer”), to the extent that he or she is an owner of Copyright
and Related Rights in the Work, voluntarily elects to apply CC0 to the Work␣
 ↪and
publicly distribute the Work under its terms, with knowledge of his or her
Copyright and Related Rights in the Work and the meaning and intended legal
effect of CC0 on those rights.

1. Copyright and Related Rights. A Work made available under CC0 may be
   protected by copyright and related or neighboring rights (“Copyright and
   Related Rights”). Copyright and Related Rights include, but are not limited
   to, the following:
   1. the right to reproduce, adapt, distribute, perform, display,␣
 ↪communicate,
      and translate a Work;
   2. moral rights retained by the original author(s) and/or performer(s);
   3. publicity and privacy rights pertaining to a person’s image or likeness
      depicted in a Work;
   4. rights protecting against unfair competition in regards to a Work,
      subject to the limitations in paragraph 4(i), below;
   5. rights protecting the extraction, dissemination, use and reuse of data␣
 ↪in
      a Work;
   6. database rights (such as those arising under Directive 96/9/EC of the
      European Parliament and of the Council of 11 March 1996 on the legal
      protection of databases, and under any national implementation thereof,
      including any amended or successor version of such directive); and
   7. other similar, equivalent or corresponding rights throughout the world
      based on applicable law or treaty, and any national implementations
      thereof.

2. Waiver. To the greatest extent permitted by, but not in contravention of,
   applicable law, Affirmer hereby overtly, fully, permanently, irrevocably␣
 ↪and
   unconditionally waives, abandons, and surrenders all of Affirmer’s␣
 ↪Copyright
   and Related Rights and associated claims and causes of action, whether now
   known or unknown (including existing as well as future claims and causes of
   action), in the Work (i) in all territories worldwide, (ii) for the maximum
   duration provided by applicable law or treaty (including future time
   extensions), (iii) in any current or future medium and for any number of
   copies, and (iv) for any purpose whatsoever, including without limitation
   commercial, advertising or promotional purposes (the “Waiver”). Affirmer
   makes the Waiver for the benefit of each member of the public at large and
   to the detriment of Affirmer’s heirs and successors, fully intending that
   such Waiver shall not be subject to revocation, rescission, cancellation,
   termination, or any other legal or equitable action to disrupt the quiet
   enjoyment of the Work by the public as contemplated by Affirmer’s express
   Statement of Purpose.

3. Public License Fallback. Should any part of the Waiver for any reason be
```

(continues on next page)

(continued from previous page)

```
   judged legally invalid or ineffective under applicable law, then the Waiver
   shall be preserved to the maximum extent permitted taking into account
   Affirmer's express Statement of Purpose. In addition, to the extent the
   Waiver is so judged Affirmer hereby grants to each affected person a
   royalty-free, non transferable, non sublicensable, non exclusive,
   irrevocable and unconditional license to exercise Affirmer's Copyright and
   Related Rights in the Work (i) in all territories worldwide, (ii) for the
   maximum duration provided by applicable law or treaty (including future␣
 ↪time
   extensions), (iii) in any current or future medium and for any number of
   copies, and (iv) for any purpose whatsoever, including without limitation
   commercial, advertising or promotional purposes (the "License"). The␣
 ↪License
   shall be deemed effective as of the date CC0 was applied by Affirmer to the
   Work. Should any part of the License for any reason be judged legally
   invalid or ineffective under applicable law, such partial invalidity or
   ineffectiveness shall not invalidate the remainder of the License, and in
   such case Affirmer hereby affirms that he or she will not (i) exercise any
   of his or her remaining Copyright and Related Rights in the Work or (ii)
   assert any associated claims and causes of action with respect to the Work,
   in either case contrary to Affirmer's express Statement of Purpose.

4. Limitations and Disclaimers.
   1. No trademark or patent rights held by Affirmer are waived, abandoned,
      surrendered, licensed or otherwise affected by this document.
   2. Affirmer offers the Work as-is and makes no representations or␣
 ↪warranties
      of any kind concerning the Work, express, implied, statutory or
      otherwise, including without limitation warranties of title,
      merchantability, fitness for a particular purpose, non infringement, or
      the absence of latent or other defects, accuracy, or the present or
      absence of errors, whether or not discoverable, all to the greatest
      extent permissible under applicable law.
   3. Affirmer disclaims responsibility for clearing rights of other persons
      that may apply to the Work or any use thereof, including without
      limitation any person's Copyright and Related Rights in the Work.
      Further, Affirmer disclaims responsibility for obtaining any necessary
      consents, permissions or other rights required for any use of the Work.
   4. Affirmer understands and acknowledges that Creative Commons is not a
      party to this document and has no duty or obligation with respect to␣
 ↪this
      CC0 or use of the Work.

                                  AUTHOR

David H. Munro wrote Yorick and Gist.  Berkeley Yacc (byacc) generated
the Yorick parser.  The routines in Math are from LAPACK and FFTPACK;
MathC contains C translations by David H. Munro.  The algorithms for
Yorick's random number generator and several special functions in
Yorick/include were taken from Numerical Recipes by Press, et. al.,
although the Yorick implementations are unrelated to those in
Numerical Recipes.  A small amount of code in Gist was adapted from
the X11R4 release, copyright M.I.T. -- the complete copyright notice
may be found in the (unused) file Gist/host.c.

This Font Software is licensed under the SIL Open Font License, Version 1.1.
This license is copied below, and is also available with a FAQ at:
http://scripts.sil.org/OFL

-----------------------------------------------------------
SIL OPEN FONT LICENSE Version 1.1 - 26 February 2007
-----------------------------------------------------------

PREAMBLE
The goals of the Open Font License (OFL) are to stimulate worldwide
development of collaborative font projects, to support the font creation
efforts of academic and linguistic communities, and to provide a free and
open framework in which fonts may be shared and improved in partnership
with others.

The OFL allows the licensed fonts to be used, studied, modified and
redistributed freely as long as they are not sold by themselves. The
fonts, including any derivative works, can be bundled, embedded,
```

(continues on next page)

(continued from previous page)

```
redistributed and/or sold with any software provided that any reserved
names are not used by derivative works. The fonts and derivatives,
however, cannot be released under any other type of license. The
requirement for fonts to remain under this license does not apply
to any document created using the fonts or their derivatives.

DEFINITIONS
"Font Software" refers to the set of files released by the Copyright
Holder(s) under this license and clearly marked as such. This may
include source files, build scripts and documentation.

"Reserved Font Name" refers to any names specified as such after the
copyright statement(s).

"Original Version" refers to the collection of Font Software components as
distributed by the Copyright Holder(s).

"Modified Version" refers to any derivative made by adding to, deleting,
or substituting -- in part or in whole -- any of the components of the
Original Version, by changing formats or by porting the Font Software to a
new environment.

"Author" refers to any designer, engineer, programmer, technical
writer or other person who contributed to the Font Software.

PERMISSION & CONDITIONS
Permission is hereby granted, free of charge, to any person obtaining
a copy of the Font Software, to use, study, copy, merge, embed, modify,
redistribute, and sell modified and unmodified copies of the Font
Software, subject to the following conditions:

1) Neither the Font Software nor any of its individual components,
in Original or Modified Versions, may be sold by itself.

2) Original or Modified Versions of the Font Software may be bundled,
redistributed and/or sold with any software, provided that each copy
contains the above copyright notice and this license. These can be
included either as stand-alone text files, human-readable headers or
in the appropriate machine-readable metadata fields within text or
binary files as long as those fields can be easily viewed by the user.

3) No Modified Version of the Font Software may use the Reserved Font
Name(s) unless explicit written permission is granted by the corresponding
Copyright Holder. This restriction only applies to the primary font name as
presented to the users.

4) The name(s) of the Copyright Holder(s) or the Author(s) of the Font
Software shall not be used to promote, endorse or advertise any
Modified Version, except to acknowledge the contribution(s) of the
Copyright Holder(s) and the Author(s) or with their explicit written
permission.
```

(continues on next page)

(continued from previous page)

```
5) The Font Software, modified or unmodified, in part or in whole,
must be distributed entirely under this license, and must not be
distributed under any other license. The requirement for fonts to
remain under this license does not apply to any document created
using the Font Software.

TERMINATION
This license becomes null and void if any of the above conditions are
not met.

DISCLAIMER
THE FONT SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND,
EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTIES OF
MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT
OF COPYRIGHT, PATENT, TRADEMARK, OR OTHER RIGHT. IN NO EVENT SHALL THE
COPYRIGHT HOLDER BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY,
INCLUDING ANY GENERAL, SPECIAL, INDIRECT, INCIDENTAL, OR CONSEQUENTIAL
DAMAGES, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING
FROM, OUT OF THE USE OR INABILITY TO USE THE FONT SOFTWARE OR FROM
OTHER DEALINGS IN THE FONT SOFTWARE.
```

### BaKoMa

```
                    BaKoMa Fonts Licence
                    --------------------

  This licence covers two font packs (known as BaKoMa Fonts Collection,
  which is available at `CTAN:fonts/cm/ps-type1/bakoma/'):

    1) BaKoMa-CM (1.1/12-Nov-94)
       Computer Modern Fonts in PostScript Type 1 and TrueType font formats.

    2) BaKoMa-AMS (1.2/19-Jan-95)
       AMS TeX fonts in PostScript Type 1 and TrueType font formats.

  Copyright (C) 1994, 1995, Basil K. Malyshev. All Rights Reserved.

  Permission to copy and distribute these fonts for any purpose is
  hereby granted without fee, provided that the above copyright notice,
  author statement and this permission notice appear in all copies of
  these fonts and related documentation.

  Permission to modify and distribute modified fonts for any purpose is
  hereby granted without fee, provided that the copyright notice,
  author statement, this permission notice and location of original
  fonts (http://www.ctan.org/tex-archive/fonts/cm/ps-type1/bakoma)
  appear in all copies of modified fonts and related documentation.

  Permission to use these fonts (embedding into PostScript, PDF, SVG

### Courier 10

```
The Courier10PitchBT-Bold.pfb file is a Type-1 version of
Courier 10 Pitch BT Bold by Bitstream, obtained from
<https://ctan.org/tex-archive/fonts/courierten>. It is included
here as test data only, but the following license applies.

(c) Copyright 1989-1992, Bitstream Inc., Cambridge, MA.

You are hereby granted permission under all Bitstream propriety rights
to use, copy, modify, sublicense, sell, and redistribute the 4 Bitstream
Charter (r) Type 1 outline fonts and the 4 Courier Type 1 outline fonts
for any purpose and without restriction; provided, that this notice is
left intact on all copies of such fonts and that Bitstream's trademark
is acknowledged as shown below on all unmodified copies of the 4 Charter
Type 1 fonts.

BITSTREAM CHARTER is a registered trademark of Bitstream Inc.
```

### STIX

```
The STIX fonts distributed with matplotlib have been modified from
their canonical form.  They have been converted from OTF to TTF format
using Fontforge and this script:

  #!/usr/bin/env fontforge
  i=1
  while ( i<$argc )
    Open($argv[i])
    Generate($argv[i]:r + ".ttf")
    i = i+1
  endloop

The original STIX Font License begins below.

SIL OPEN FONT LICENSE Version 1.1 - 26 February 2007
-----------------------------------------------------------

PREAMBLE
The goals of the Open Font License (OFL) are to stimulate worldwide
development of collaborative font projects, to support the font creation
efforts of academic and linguistic communities, and to provide a free and
open framework in which fonts may be shared and improved in partnership
with others.

The OFL allows the licensed fonts to be used, studied, modified and
redistributed freely as long as they are not sold by themselves. The
fonts, including any derivative works, can be bundled, embedded,
redistributed and/or sold with any software provided that any reserved
names are not used by derivative works. The fonts and derivatives,
however, cannot be released under any other type of license. The
requirement for fonts to remain under this license does not apply
to any document created using the fonts or their derivatives.

DEFINITIONS
"Font Software" refers to the set of files released by the Copyright
Holder(s) under this license and clearly marked as such. This may
include source files, build scripts and documentation.

"Reserved Font Name" refers to any names specified as such after the
copyright statement(s).

"Original Version" refers to the collection of Font Software components as
distributed by the Copyright Holder(s).

"Modified Version" refers to any derivative made by adding to, deleting,
```

(continues on next page)

(continued from previous page)

```
or substituting -- in part or in whole -- any of the components of the
Original Version, by changing formats or by porting the Font Software to a
new environment.

"Author" refers to any designer, engineer, programmer, technical
writer or other person who contributed to the Font Software.

PERMISSION & CONDITIONS
Permission is hereby granted, free of charge, to any person obtaining
a copy of the Font Software, to use, study, copy, merge, embed, modify,
redistribute, and sell modified and unmodified copies of the Font
Software, subject to the following conditions:

1) Neither the Font Software nor any of its individual components,
in Original or Modified Versions, may be sold by itself.

2) Original or Modified Versions of the Font Software may be bundled,
redistributed and/or sold with any software, provided that each copy
contains the above copyright notice and this license. These can be
included either as stand-alone text files, human-readable headers or
in the appropriate machine-readable metadata fields within text or
binary files as long as those fields can be easily viewed by the user.

3) No Modified Version of the Font Software may use the Reserved Font
Name(s) unless explicit written permission is granted by the corresponding
Copyright Holder. This restriction only applies to the primary font name as
presented to the users.

4) The name(s) of the Copyright Holder(s) or the Author(s) of the Font
Software shall not be used to promote, endorse or advertise any
Modified Version, except to acknowledge the contribution(s) of the
Copyright Holder(s) and the Author(s) or with their explicit written
permission.

5) The Font Software, modified or unmodified, in part or in whole,
must be distributed entirely under this license, and must not be
distributed under any other license. The requirement for fonts to
remain under this license does not apply to any document created
using the Font Software.

Some earlier contributors not included above are (with apologies to any we have missed):

Charles Twardy, Gary Ruben, John Gill, David Moore, Paul Barrett, Jared Wahlstrand, Jim Benson, Paul Mcguire, Andrew Dalke, Nadia Dencheva, Baptiste Carvello, Sigve Tjoraand, Ted Drain, James Amundson, Daishi Harada, Nicolas Young, Paul Kienzle, John Porter, and Jonathon Taylor.

Thanks to Tony Yu for the original logo design.

We also thank all who have reported bugs, commented on proposed changes, or otherwise contributed to Matplotlib's development and usefulness.
